## classification of curves

 $y = x^{2} + 5x + 3 \qquad \longrightarrow \qquad y = f(x)$ (explicit curve)

 $(x-x_c)^2 + (y-y_c)^2 - r^2 = 0 \longrightarrow g(x,y) = 0$ (implicit curve)

 $\begin{array}{l} \mathbf{x} = \mathbf{x}_{c} + \mathbf{r} \cdot \cos\theta \\ \mathbf{y} = \mathbf{y}_{c} + \mathbf{r} \cdot \sin\theta \end{array} \xrightarrow{\qquad} \begin{cases} x = x(t) \\ y = y(t) \end{cases}$ 

(parametric curve)

# classification of curves

#### implicit curve

• planar: f(x,y)=0:  $x^{2}+y^{2}-36=0$ 

• 3D curves

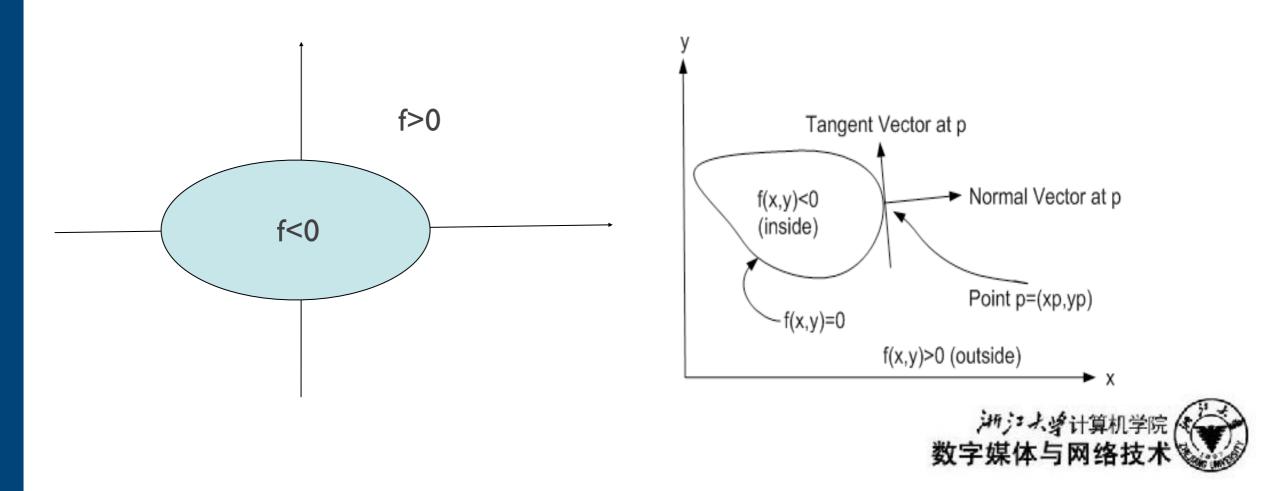

$$\begin{cases} f(x, y, z) = 0, \\ g(x, y, z) = 0. \end{cases}$$

### implicit curves

advantage of implicit curve:
To a point (x,y), it is easy to detect whether f(x,y) is >0 ,<0 or =0.</p>

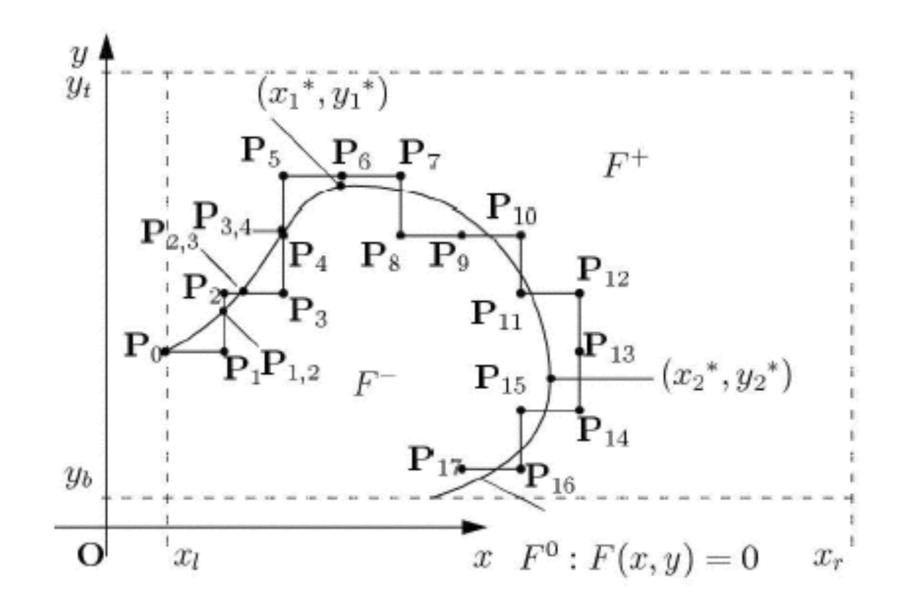

#### disadvantage of implicit curve:

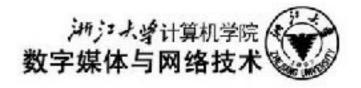

To a curve f(x,y)=0, it is difficult to find the point on it..

### implicit curves

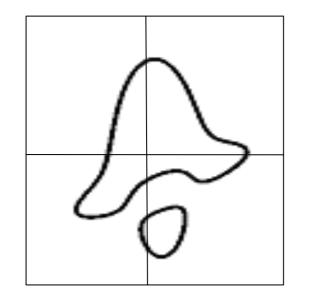

Display of implicit curves---chain coding

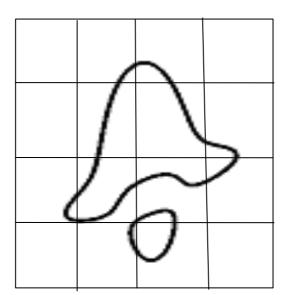

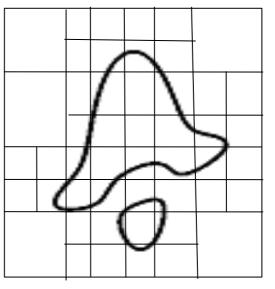

### implicit curves

### Display of implicit curves---subdivision

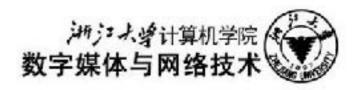

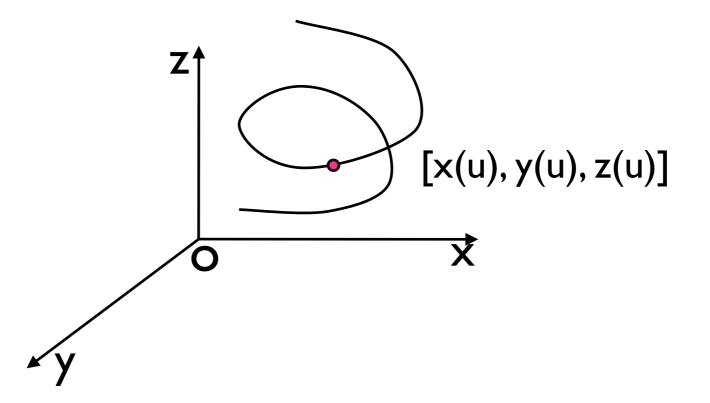

## Parametric curves

• variable is a scalar, and function is a vector:

C=C(u)=[x(u), y(u), z(u)],

 Every element of the vector is a function of the variable(the parameter)

### **Parametric curves**

given a curve C(u), its tangent is T=C'(u).

#### difference of arc length: $(ds)^2 = (dx)^2 + (dy)^2 + (dz)^2 = ((x')^2 + (y')^2 + (z')^2)d^2u$

# Parametric curves and splines

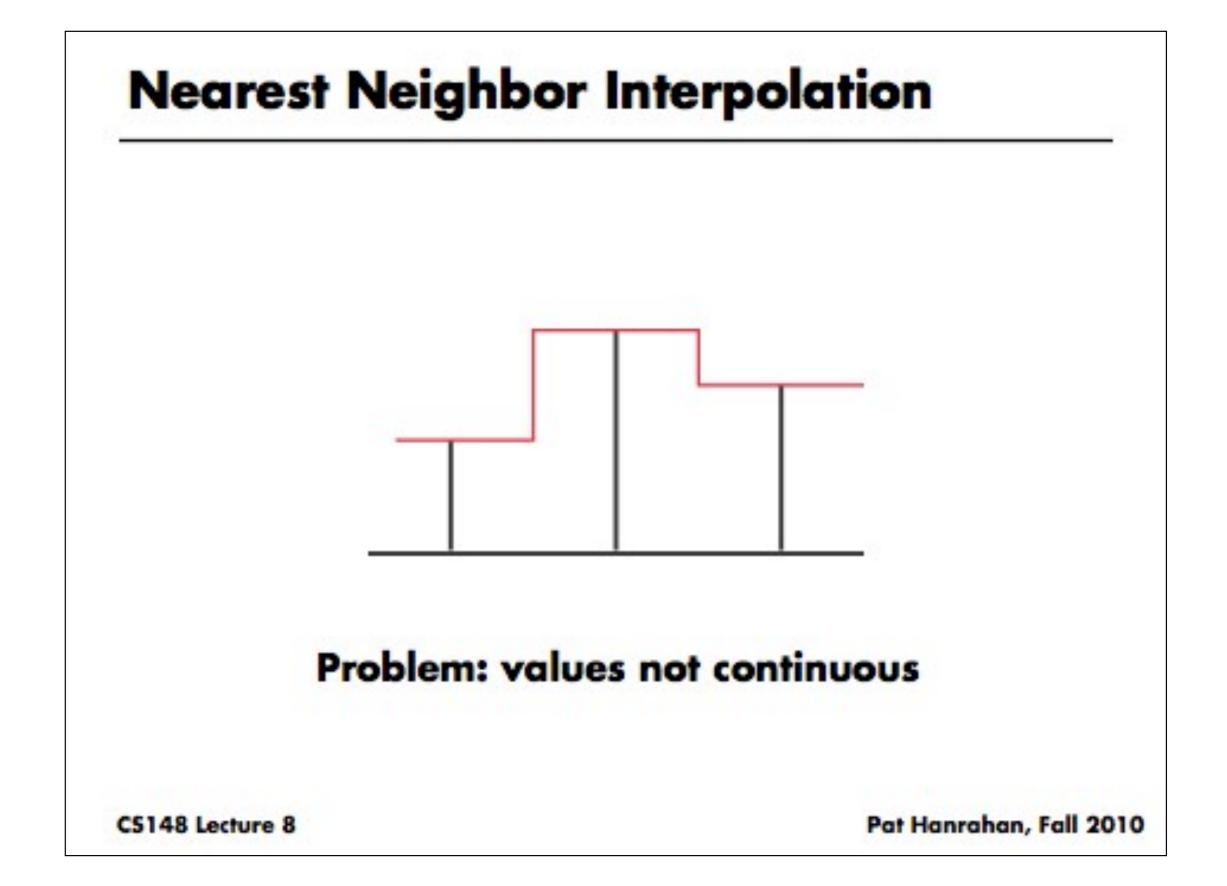

- Cubic Hermite interpolation
- Catmull-Rom interpolation
- Bezier curves

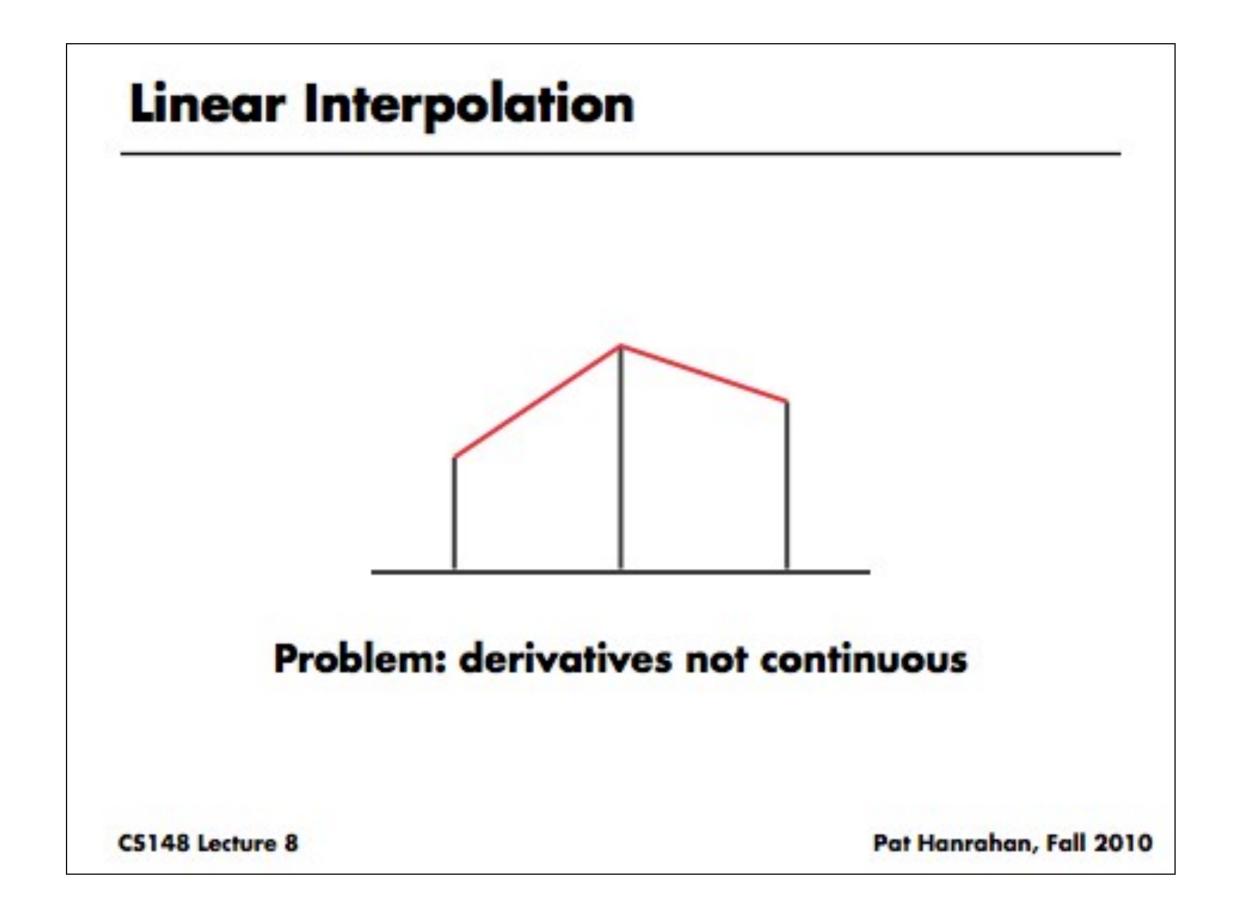

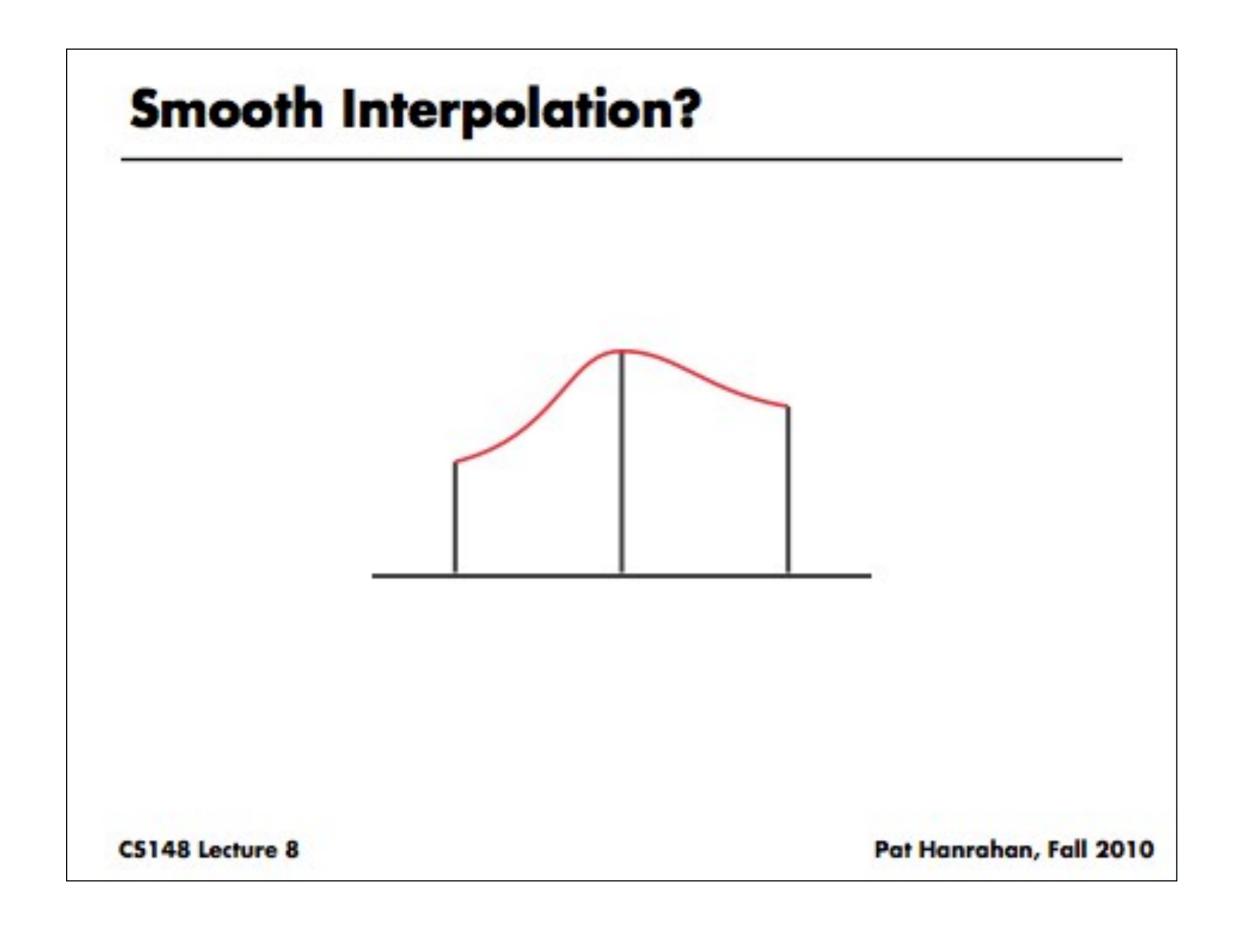

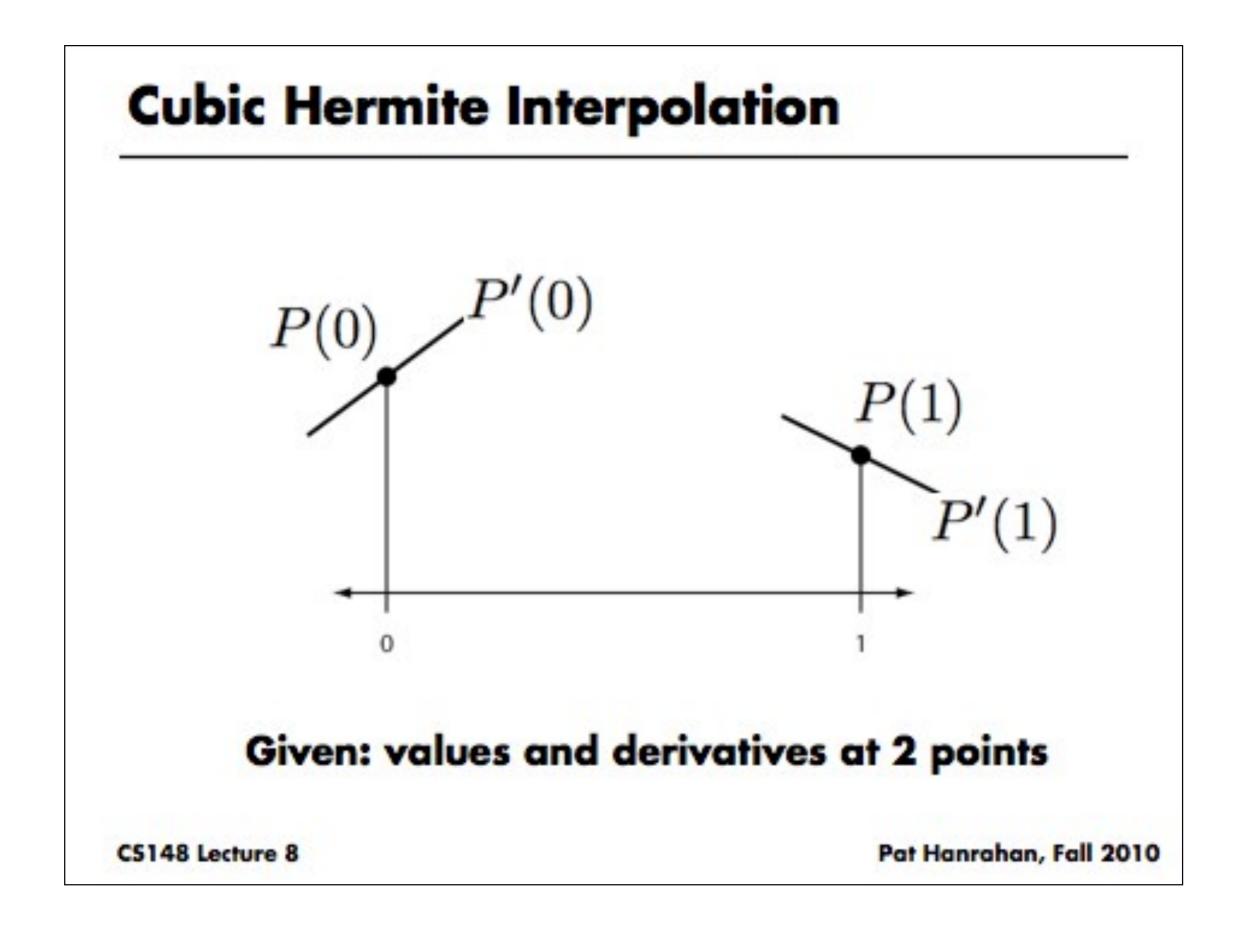

### **Goal: Interpolate Values**

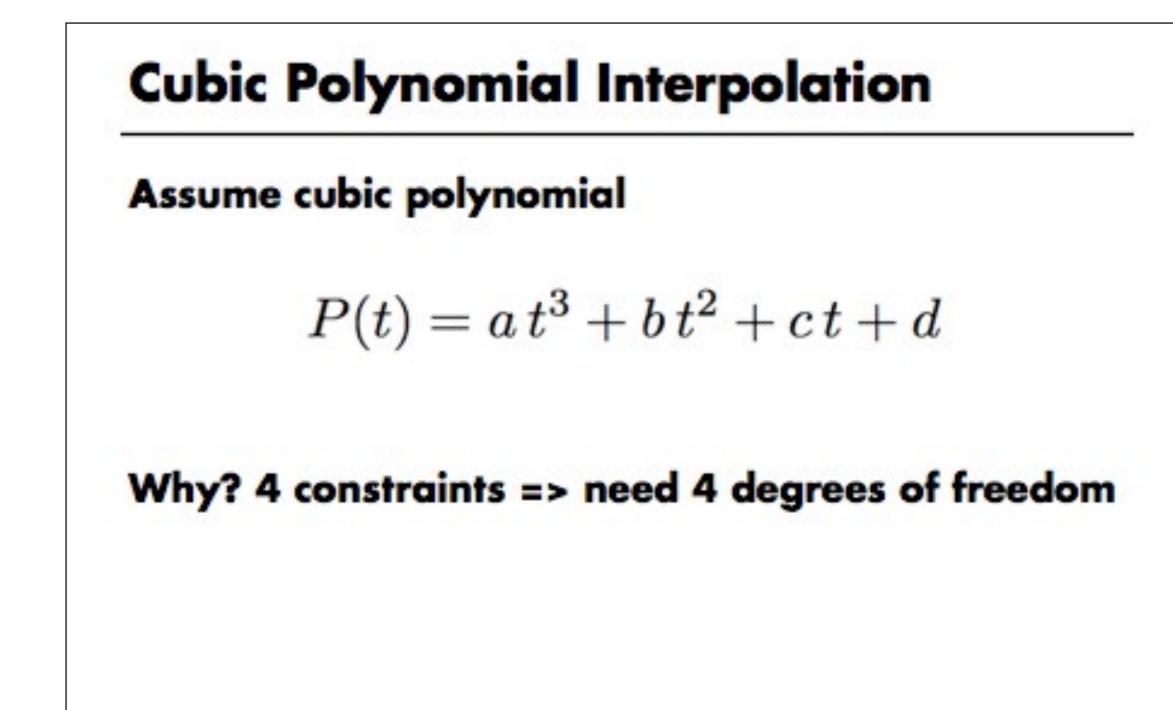

C5148 Lecture 8

Pat Hanrahan, Fall 2010

### **Cubic Hermite Interpolation**

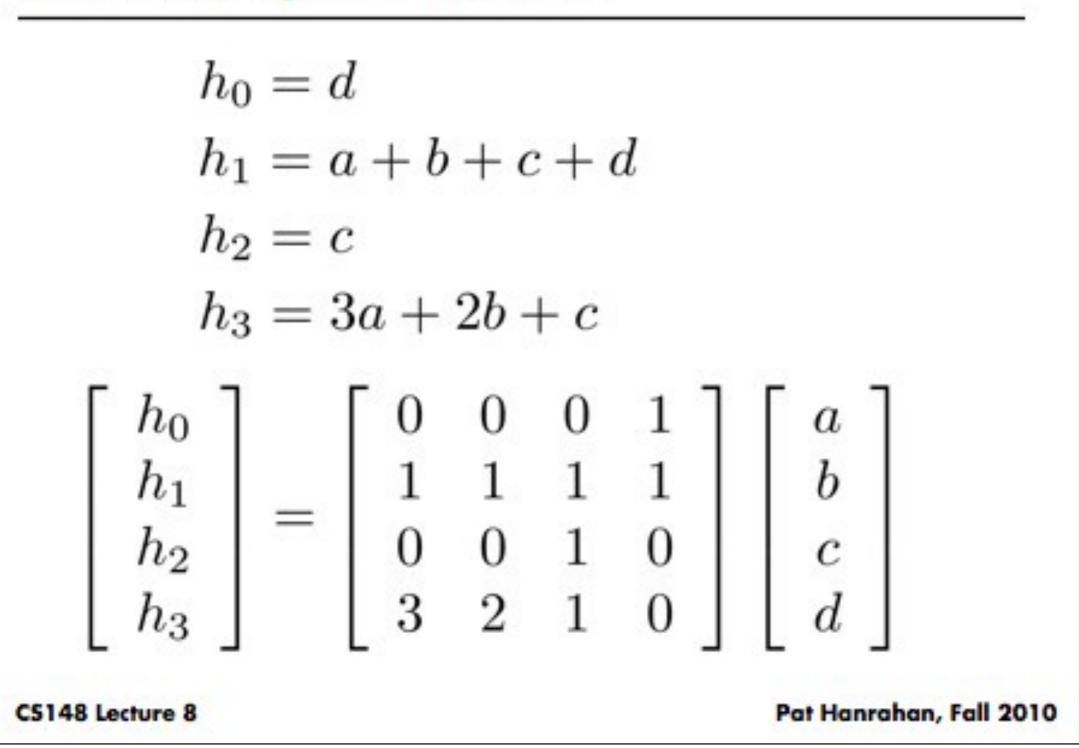

#### Assume cubic polynomial

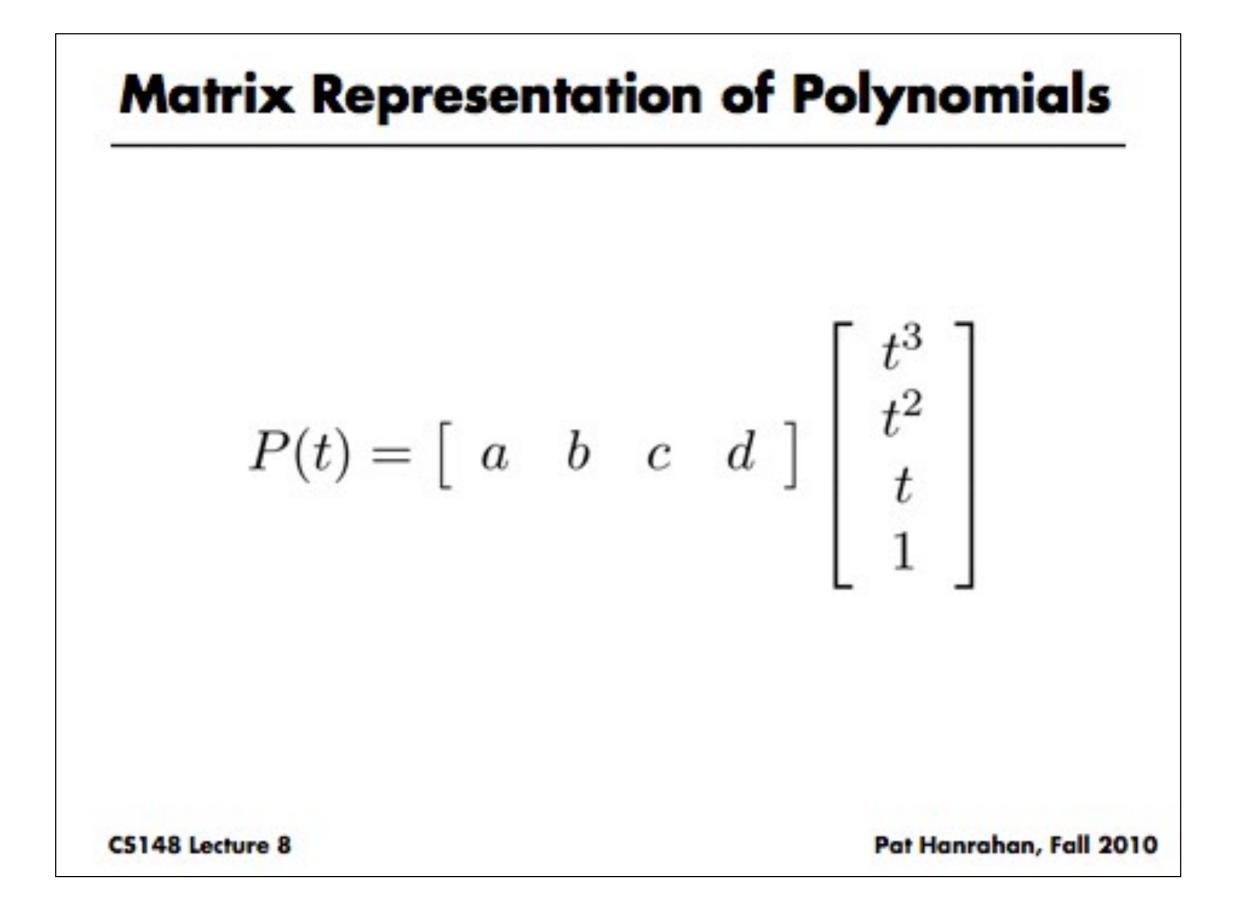

$$P(t) = a t^{3} + b t^{2} + c t + d$$
$$P'(t) = 3a t^{2} + 2b t + c$$

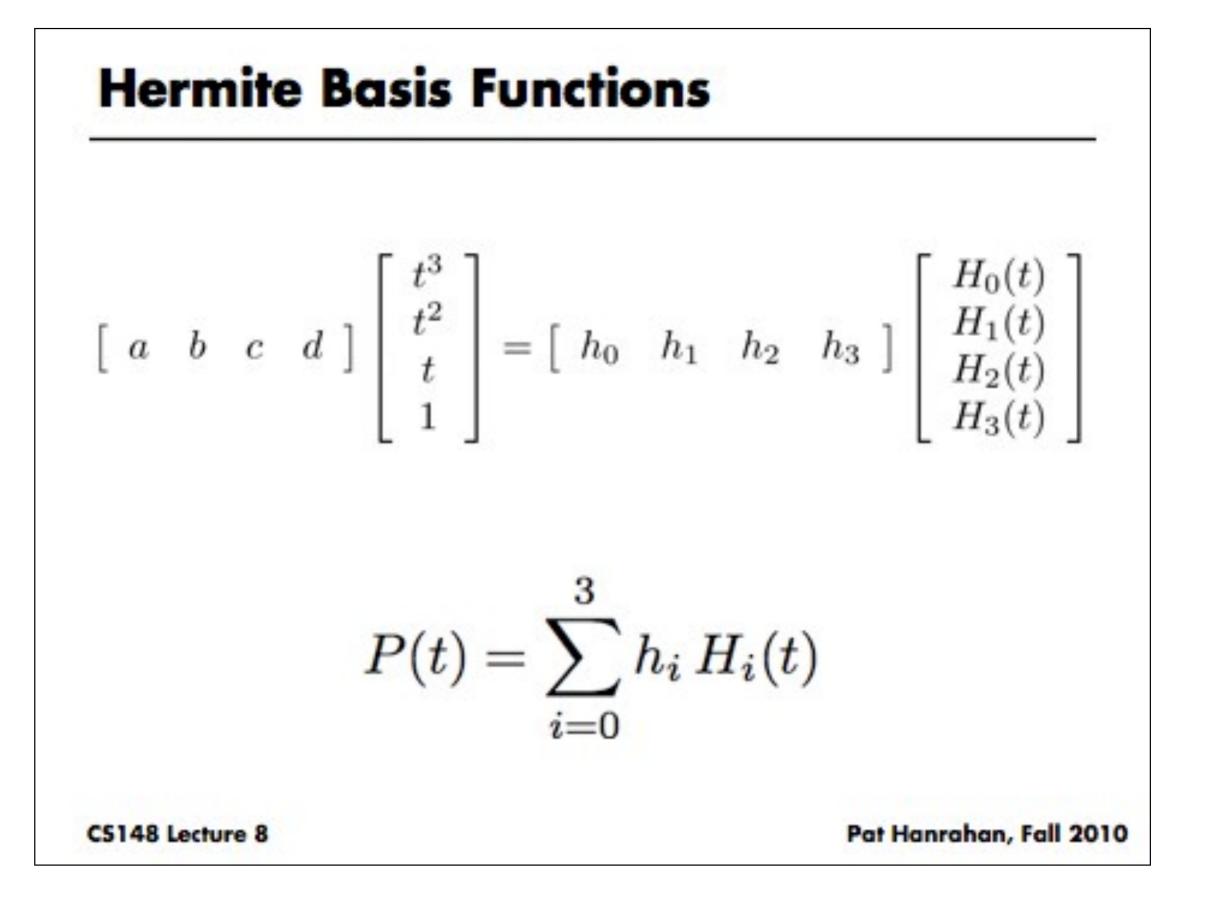

Solve for coefficients:

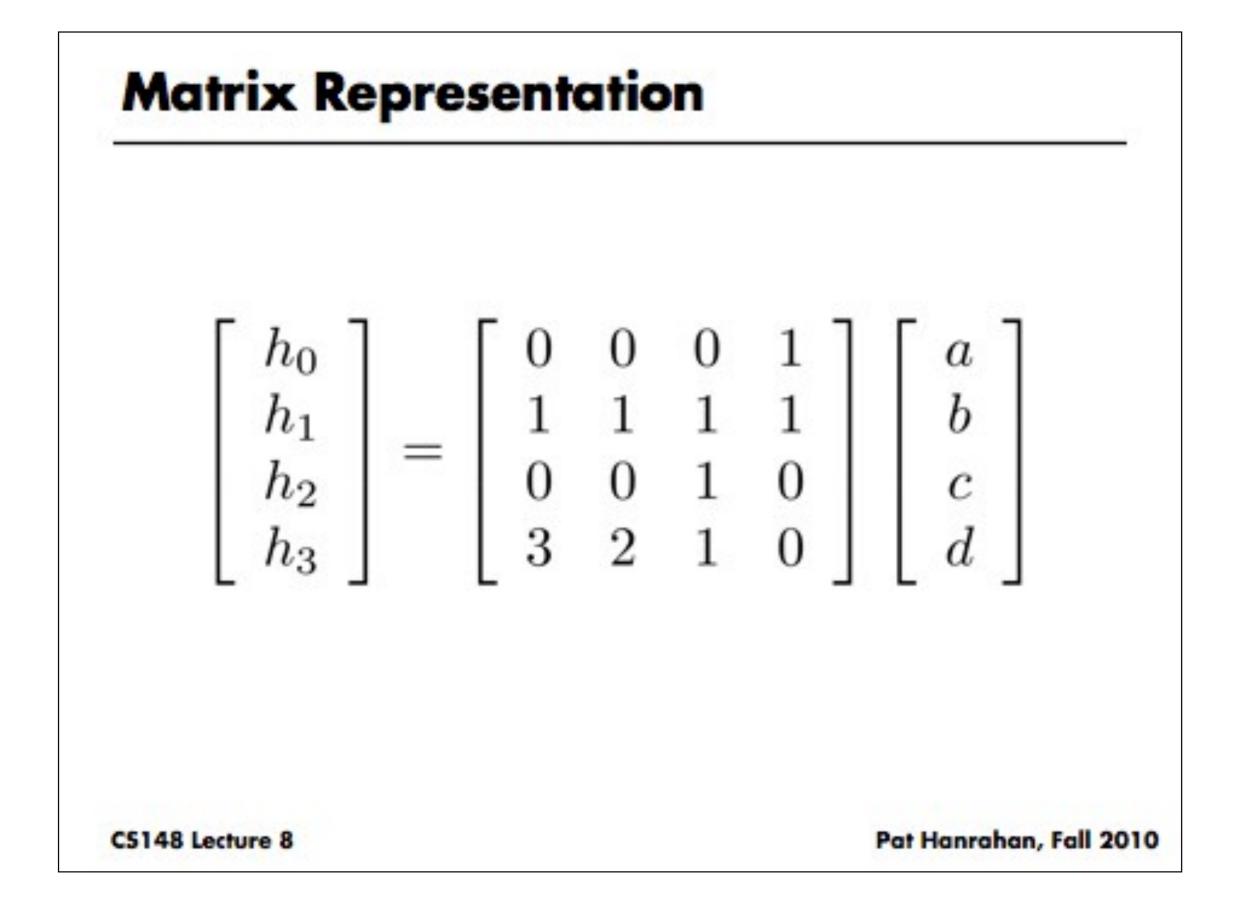

$$P(0) = h_0 = d$$
  
 $P(1) = h_1 = a + b + c + d$   
 $P'(0) = h_2 = c$   
 $P'(1) = h_3 = 3a + 2b + c$   
Pat Hanrahan, Fall 2010

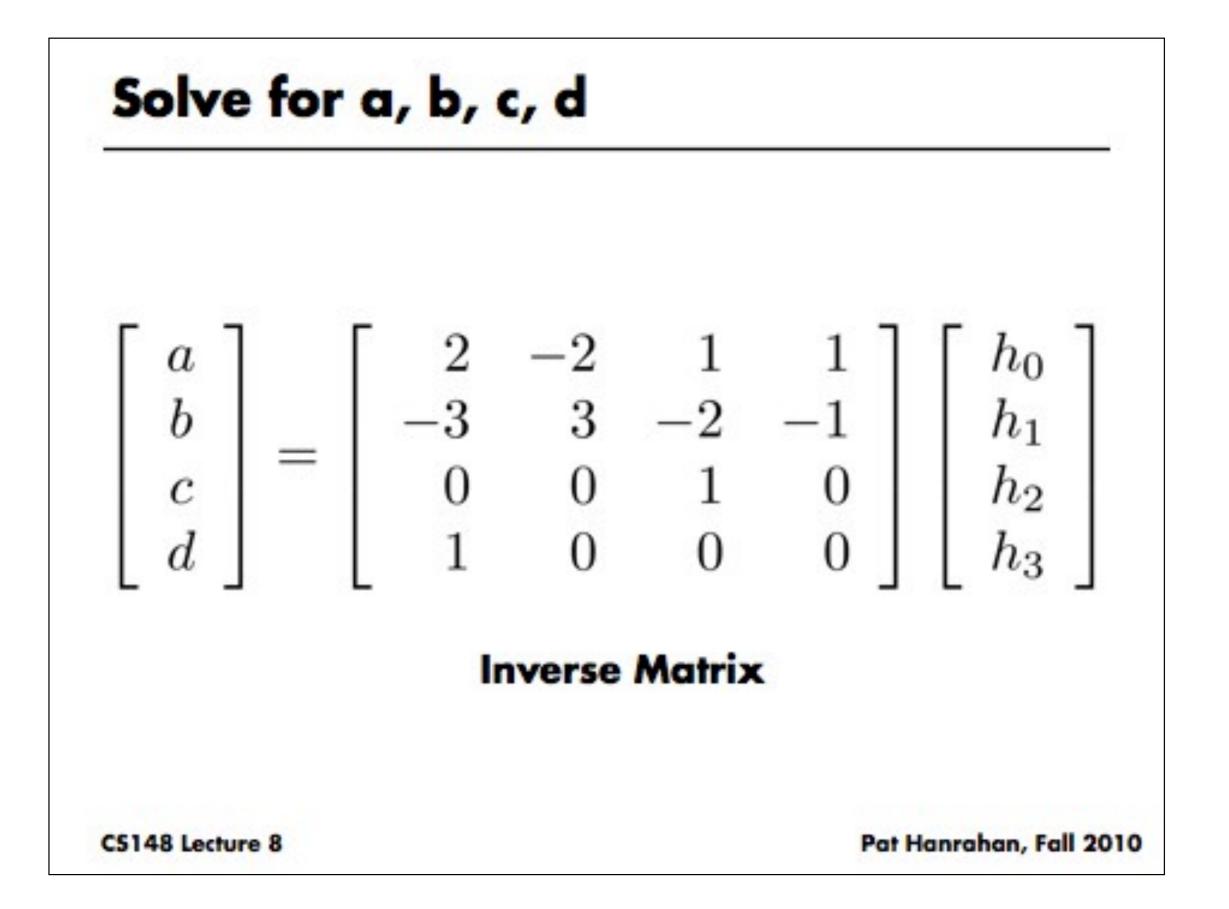

### **Matrix Representation**

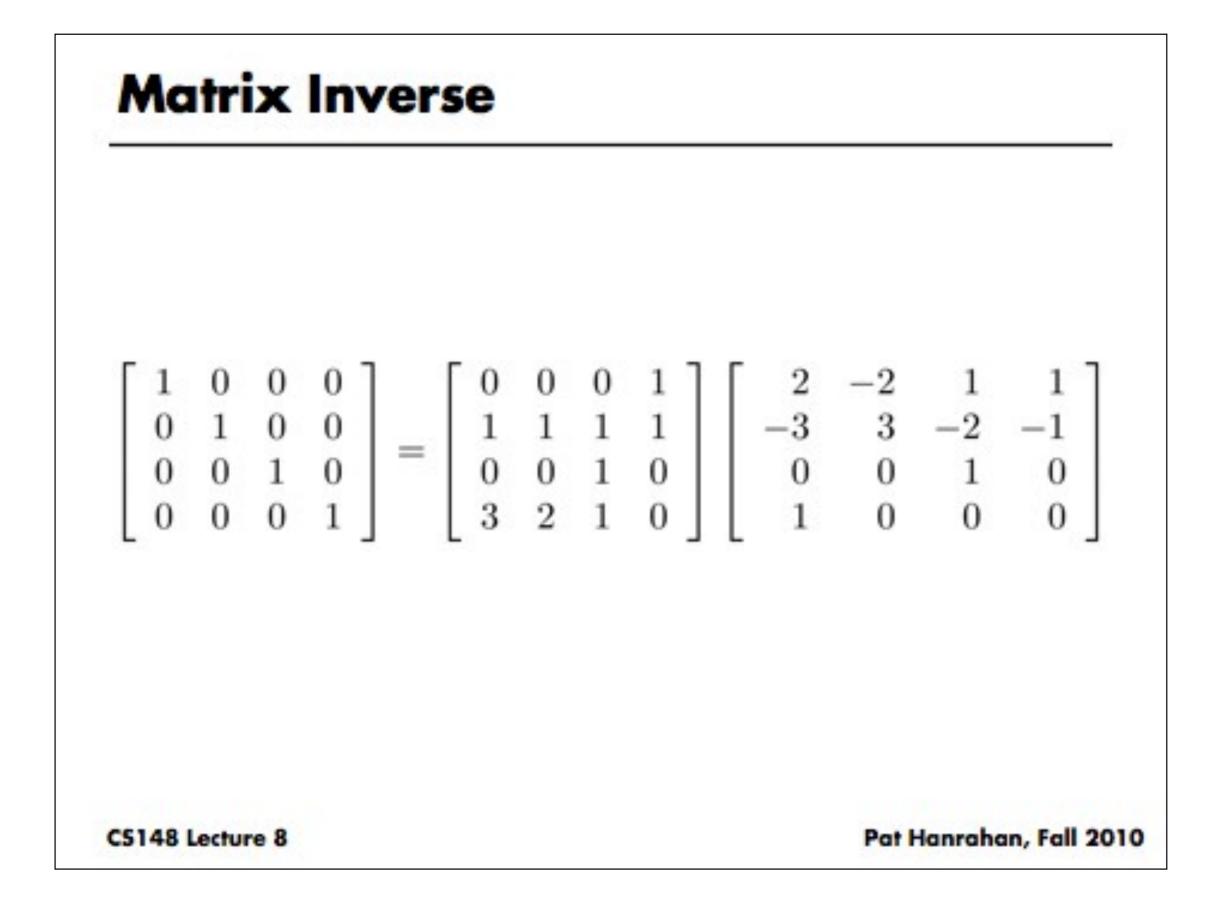

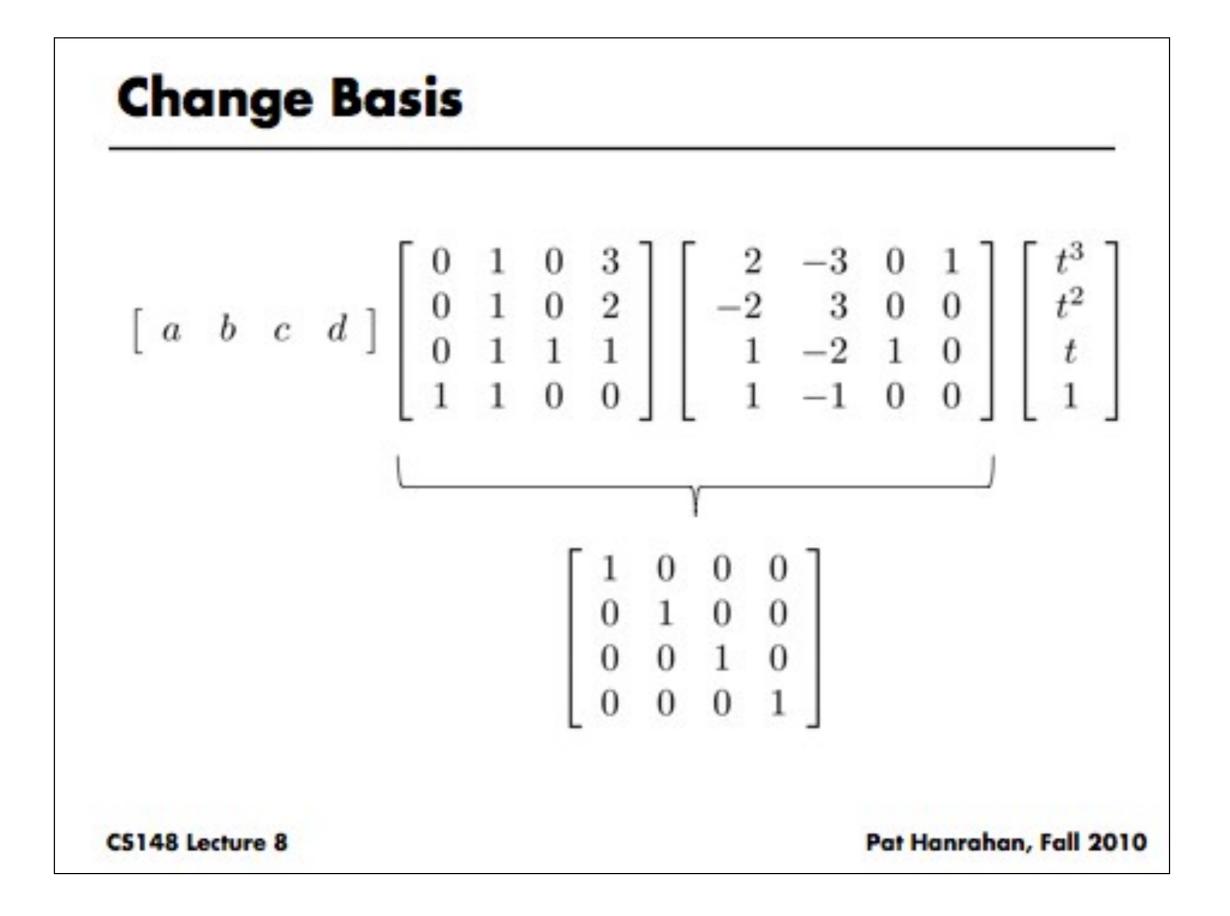

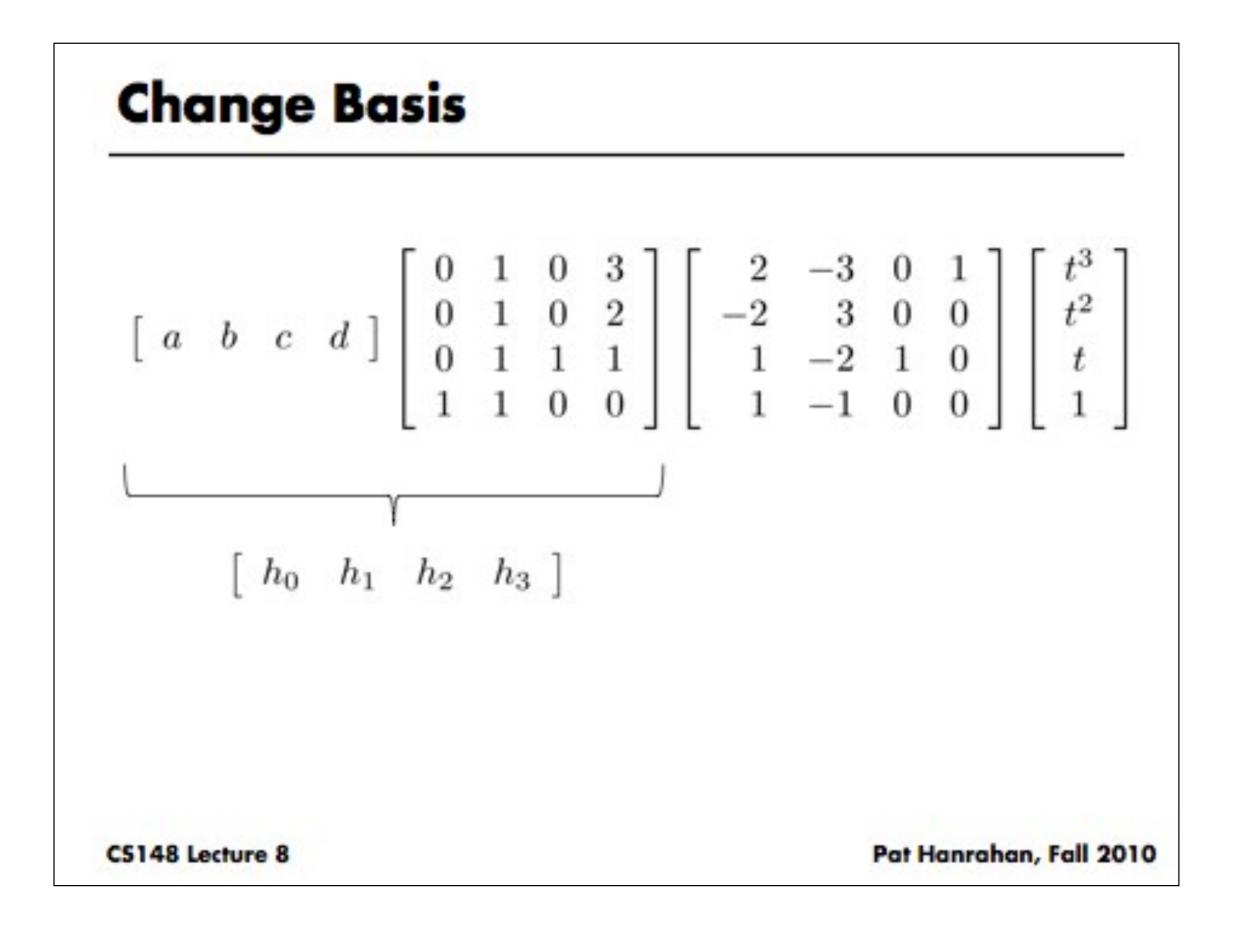

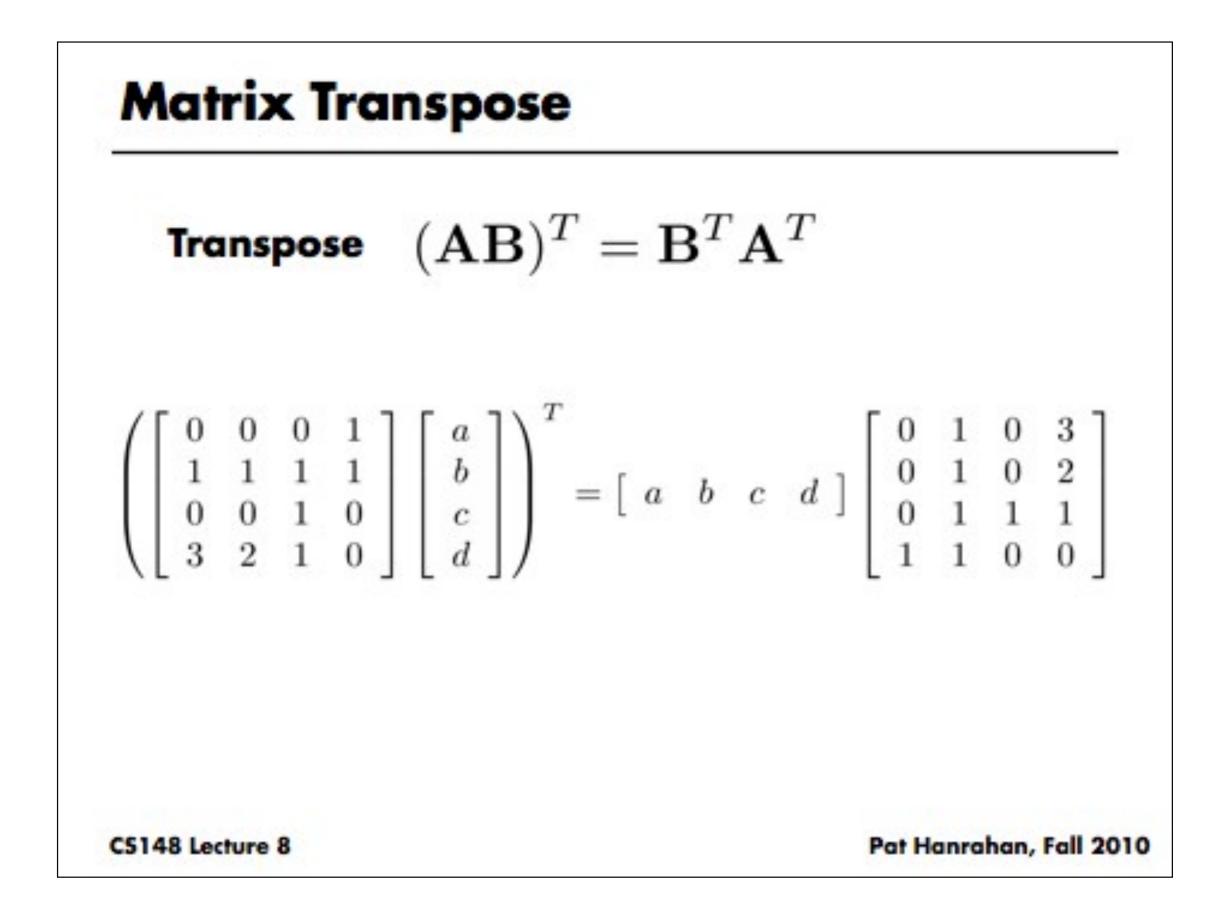

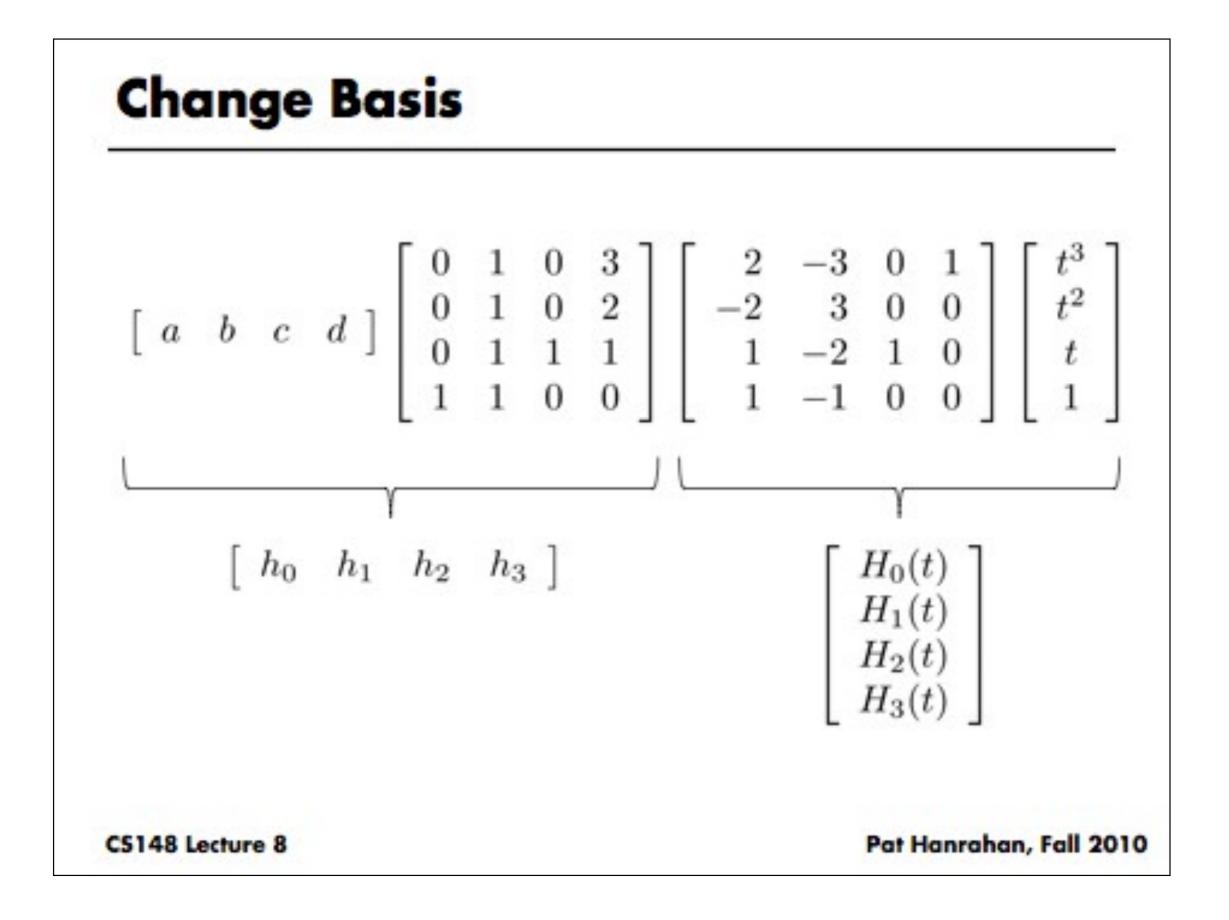

### **Hermite Basis Functions**

$$\begin{bmatrix} H_0(t) \\ H_1(t) \\ H_2(t) \\ H_3(t) \end{bmatrix} = \begin{bmatrix} 2 & -3 & 0 & 1 \\ -2 & 3 & 0 & 0 \\ 1 & -2 & 1 & 0 \\ 1 & -1 & 0 & 0 \end{bmatrix} \begin{bmatrix} t^3 \\ t^2 \\ t \\ 1 \end{bmatrix}$$
$$H_0(t) = 2t^3 - 3t^2 + 1$$

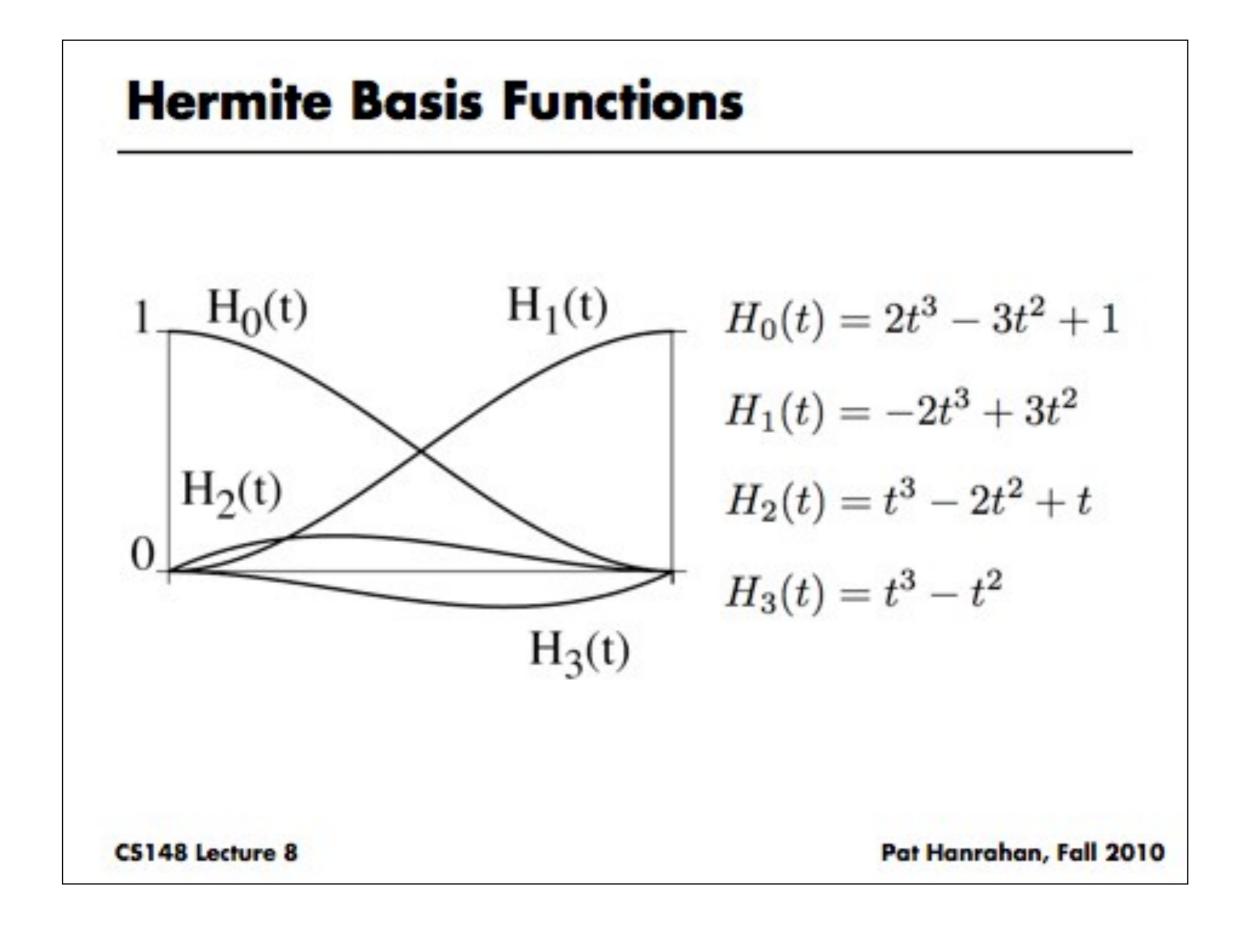

$$H_1(t) = -2t^3 + 3t^2$$

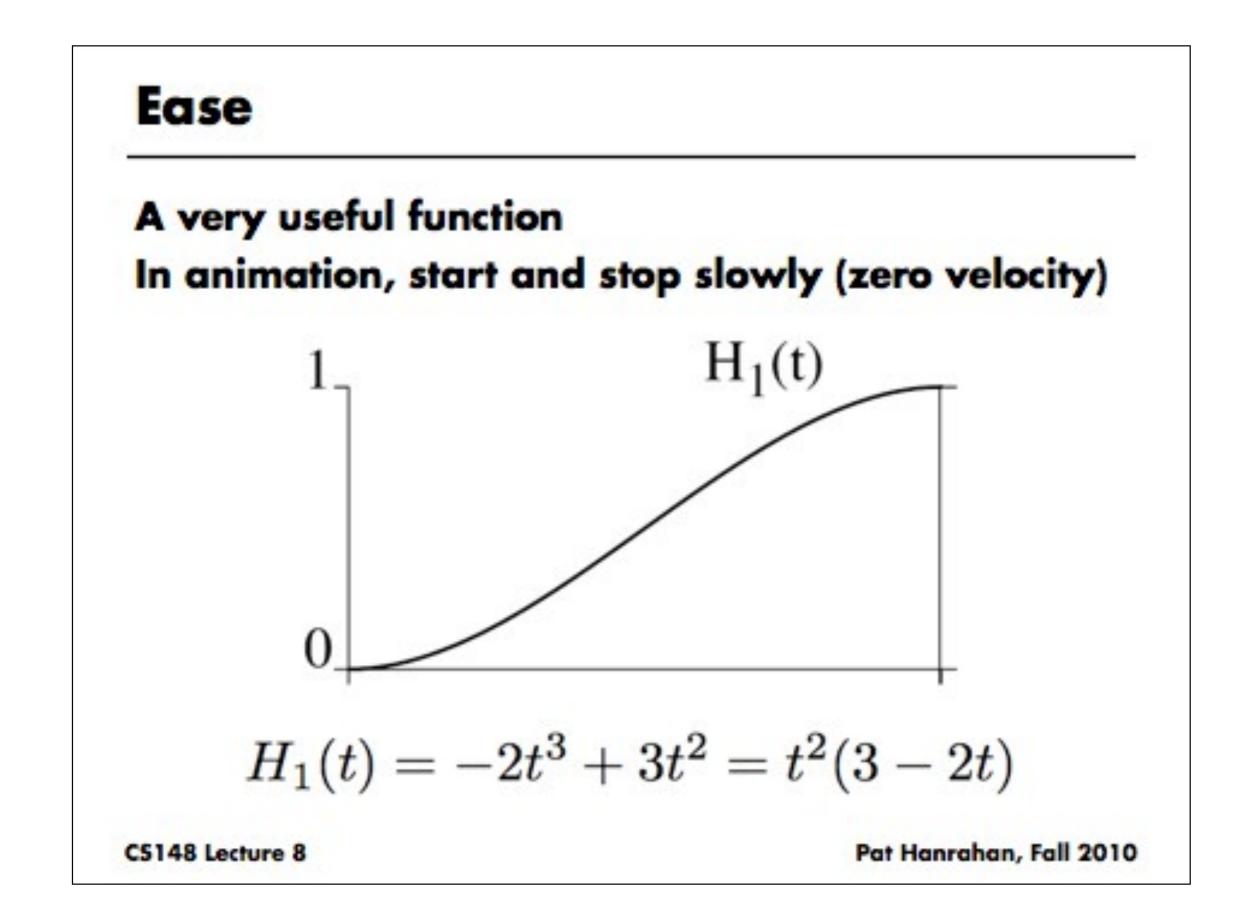

$$H_2(t) = t^3 - 2t^2 + t$$

$$H_3(t) = t^3 - t^2$$

**Bézier curve** 

$$C(t) = \sum_{i=0}^{n} P_i B_{i,n}(t), t \in [0,1]$$

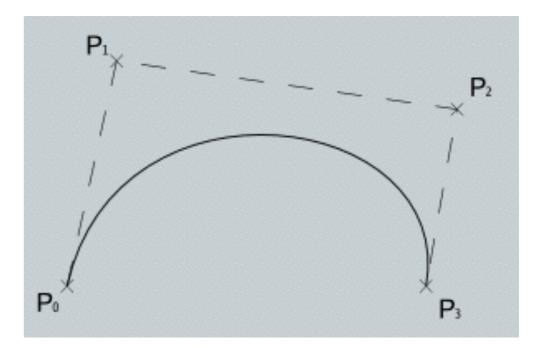

where,  $P_i$  (*i*=0,1,...,n) are control points.

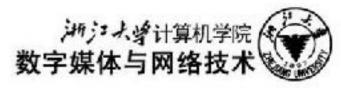

$$B_{i,n}(t) = C_n^i t^i (1-t)^{n-i}, t \in [0,1]$$

**Bernstein basis** 

$$\begin{cases} \mathbf{X}(\mathbf{t}) = \sum_{i=0}^{n} x_{i} B_{i,t}(t) \\ \mathbf{Y}(\mathbf{t}) = \sum_{i=0}^{n} y_{i} B_{i,t}(t) \end{cases}$$

$$C(t) = \begin{pmatrix} \mathbf{X}(t) \\ \frac{1}{2} \\ \mathbf{Y}(t) \end{pmatrix}, \quad P_i = \begin{pmatrix} x_i \\ y_i \end{pmatrix}$$

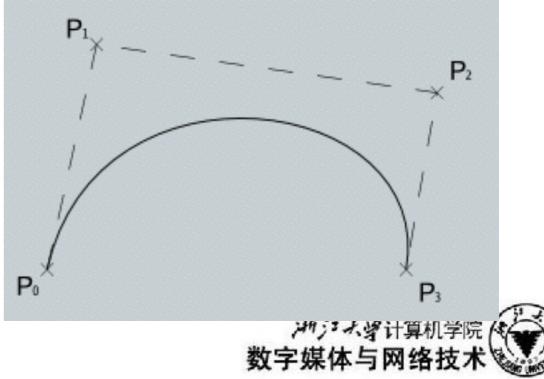

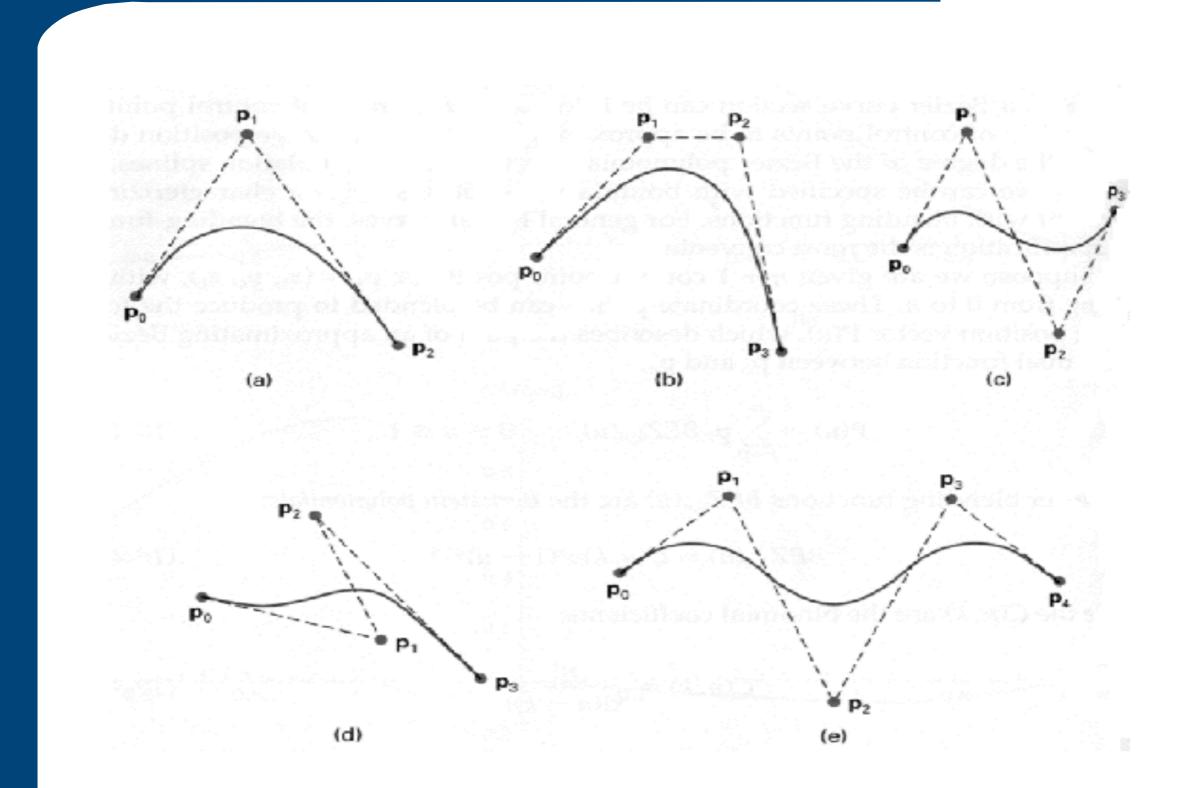

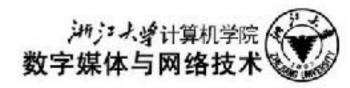

$$\begin{cases} \mathbf{X}(\mathbf{t}) = \sum_{i=0}^{n} x_{i} B_{i,t}(t) \\ \mathbf{Y}(\mathbf{t}) = \sum_{i=0}^{n} y_{i} B_{i,t}(t) \end{cases} \qquad \begin{cases} \mathbf{X}(\mathbf{t}) = \sum_{i=0}^{n} a_{i} t^{i} \\ \mathbf{Y}(\mathbf{t}) = \sum_{i=0}^{n} b_{i} t^{i} \end{cases}$$

$$B_{i,n}(t) = C_n^i t^i (1-t)^{n-i}, t \in [0,1]$$

$$C(t) = \begin{pmatrix} \mathbf{X}(t) \\ \mathbf{Y}(t) \end{pmatrix}, \quad P_i = \begin{pmatrix} x_i \\ y_i \end{pmatrix}$$

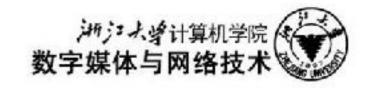

Properties of Bernstein basis

$$B_{i,n}(t) = C_n^i t^i (1-t)^{n-i}, t \in [0,1]$$

1. 
$$B_{i,n}(t) \ge 0, \ i = 0, 1, L, n, \ t \in [0, 1].$$
  
2.  $\sum_{i=0}^{n} B_{i,n}(t) = 1, \ t \in [0, 1].$   
3.  $B_{i,n}(t) = B_{n-i,n}(1-t),$   
4.  $i = 0, 1, L, n, \ t \in [0, 1].$   
4.  $B_{i,n}(0) = \begin{cases} 1, \ i = 0, \\ 0, \ else; \end{cases} B_{i,n}(1) = \begin{cases} 1, \ i = n, \\ 0, \ else. \end{cases}$ 

7.

#### Properties of Bernstein basis

<sup>5.</sup> 
$$B_{i,n}(t) = (1-t)B_{i,n-1}(t) + tB_{i-1,n-1}(t), i = 0, 1, ..., n.$$

<sup>6.</sup> 
$$B'_{i,n}(t) = n[B_{i-1,n-1}(t) - B_{i,n-1}(t)], \ i = 0, 1, ..., n.$$

$$(1-t)B_{i,n}(t) = (1 - \frac{i}{n+1})B_{i,n+1}(t);$$
  

$$tB_{i,n}(t) = \frac{i+1}{n+1}B_{i+1,n+1}(t);$$
  

$$B_{i,n}(t) = (1 - \frac{i}{n+1})B_{i,n+1}(t) + \frac{i+1}{n+1}B_{i+1,n+1}(t).$$
  

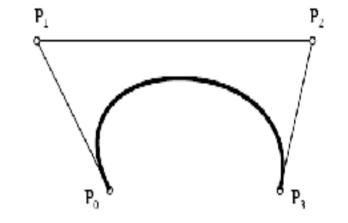

$$\lim_{i \to i} J = J = J$$

# properties of Bézier curves

$$C(t) = \sum_{i=0}^{n} P_i B_{i,n}(t), t \in [0,1]$$

I. Endpoint Interpolation: interpolating two end points

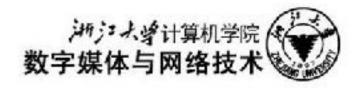

$$C(0) = P_0, C(1) = P_n.$$

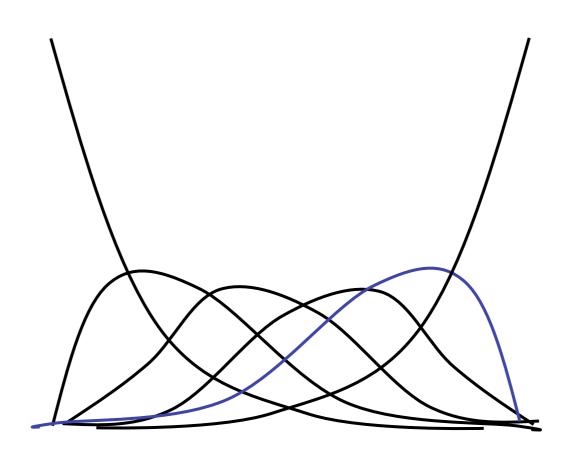

2. tangent direction of  $P_0: P_0P_1$ , tangent direction of  $P_n: P_{n-1}P_n$ .

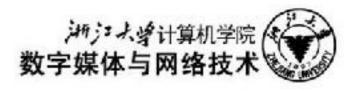

$$C'(t) = n \sum_{i=0}^{n-1} (P_{i+1} - P_i) B_{i,n-1}(t), \ t \in [0,1]; \ C'(0) = n (P_1 - P_0), C'(1) = n (P_n - P_{n-1}).$$

**3. Symmetry:** Let two Bezier curves be generated by ordered Bezier (control) points labelled by {p0,p1,...,pn} and {pn, pn-1,..., p0} respectively, then the curves corresponding to the two different orderings of control points look the same; they differ only in the direction in which they are traversed.

**3. Symmetry:** Let two Bezier curves be generated by ordered Bezier (control) points labelled by {p0,p1,...,pn} and {pn, pn-1,..., p0} respectively, then the curves corresponding to the two different orderings of control points look the same; they differ only in the direction in which they are traversed.

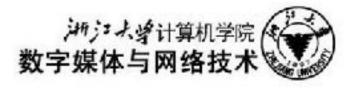

## properties of Bézier curves

$$C(t) = \sum_{i=0}^{n} P_i B_{i,n}(t), \quad t \in [0,1]$$

#### 4. Affine Invariance –

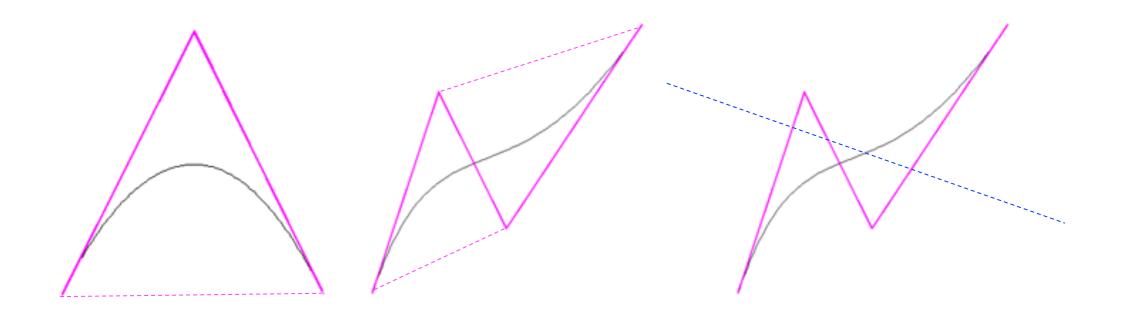

the following two procedures yield the same result: (1) first, from starting control points {p0, p1,..., pn} compute the curve and then apply an affine map to it; (2) first apply an affine map to the control points {p0, p1,..., pn} to obtain new control points {F(p0),...,F(pn)} and then find the curve with these new control points.

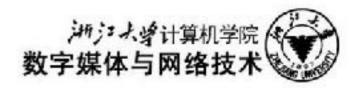

# properties of Bézier curves

5. Convex Hull Property : Bézier curve C(t) lies in the convex hull of the control points  $P_0, P_1, ..., P_n$ ;

6. *variation diminishing* property. Informally this means that the Bezier curve will not "wiggle" any more than the control polygon does..

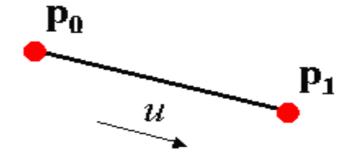

### Bézier curves

**1. linear:**  $C(t) = (1-t)P_0 + tP_1, t \in [0,1],$ 

$$\boldsymbol{C}(t) = \begin{bmatrix} t, 1 \end{bmatrix} \begin{bmatrix} -1 & 1 \\ 1 & 0 \end{bmatrix} \begin{bmatrix} \boldsymbol{P}_0 \\ \boldsymbol{P}_1 \end{bmatrix}$$

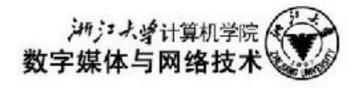

2. quadratic

$$\boldsymbol{C}(t) = (1-t)^2 \boldsymbol{P}_0 + 2t(1-t)\boldsymbol{P}_1 + t^2 \boldsymbol{P}_2$$

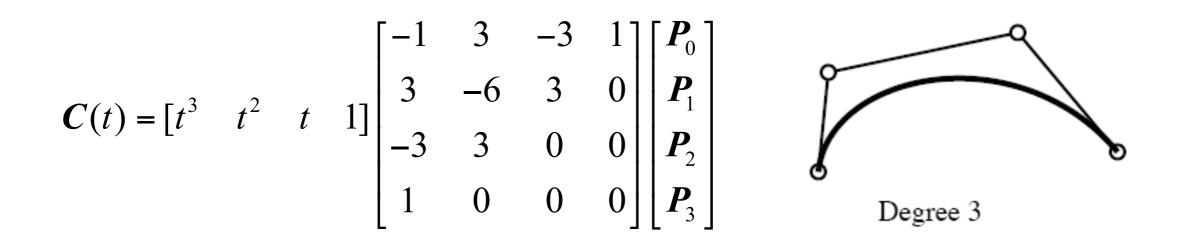

Degree 2

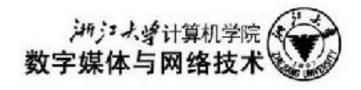

$$C(t) = \begin{bmatrix} t^2 & t & 1 \end{bmatrix} \begin{bmatrix} 1 & -2 & 1 \\ -2 & 2 & 0 \\ 1 & 0 & 0 \end{bmatrix} \begin{bmatrix} P_0 \\ P_1 \\ P_2 \end{bmatrix}$$

#### 3. cubic:

$$\boldsymbol{C}(t) = (1-t)^{3} \boldsymbol{P}_{0} + 3t(1-t)^{2} \boldsymbol{P}_{1} + 3t^{2}(1-t)\boldsymbol{P}_{2} + t^{3} \boldsymbol{P}_{3}$$

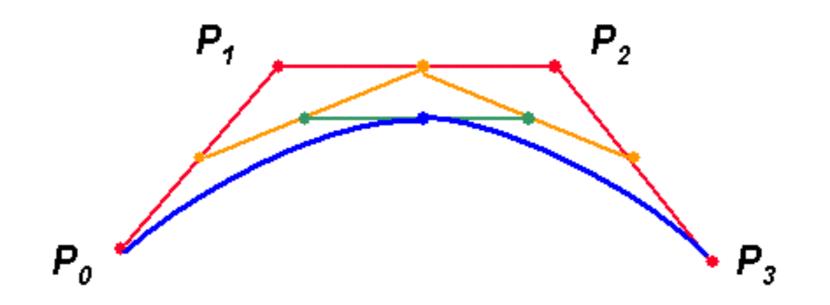

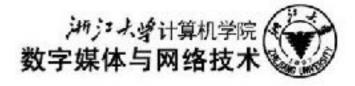

### **De Casteljau algorithm**

given the control points  $P_0, P_1, ..., P_n$ , and t of Bézier curve, let:

$$\boldsymbol{P}_{i}^{r}(t) = (1-t)\boldsymbol{P}_{i}^{r-1}(t) + t\boldsymbol{P}_{i+1}^{r-1}(t), \text{ Æä } \begin{cases} r = 1, ..., n; \ i = 0, ..., n-r \\ P_{i}^{0}(u) = P_{i} \end{cases}$$

then  $P_0^n(t) = C(t)$ .

#### **Rational Bézier Curve**

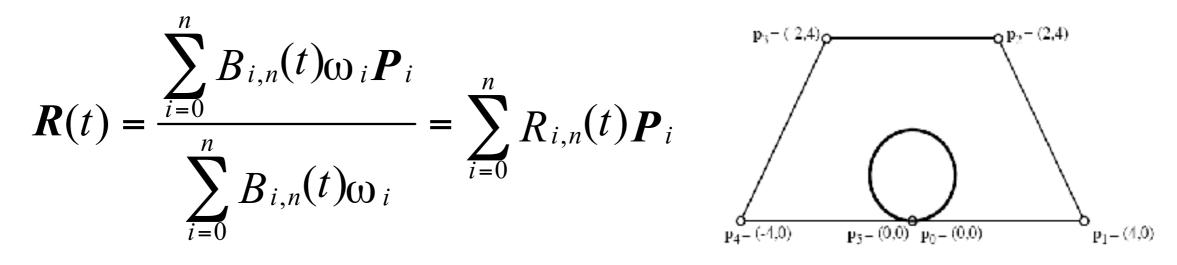

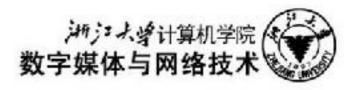

Figure 2.19: Circle as Degree 5 Rational Bézier Curve.

where  $B_{i,n}(t)$  is Bernstein basis,  $\omega_i$  is the weight at  $p_i$ .

It's a generalization of Bézier curve, which can express more curves, such as circle.

## Properties of rational Bézier curve:

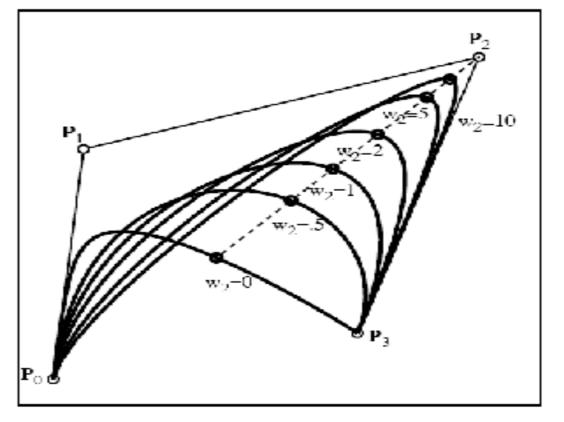

1. endpoints:  $R(0) = P_0$ ;  $R(1) = P_n$ 

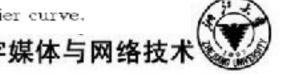

2. tangent of endpoints:

$$\boldsymbol{R}'(0) = n \frac{\omega_1}{\omega_0} (\boldsymbol{P}_1 - \boldsymbol{P}_0); \ \boldsymbol{R}'(1) = n \frac{\omega_{n-1}}{\omega_n} (\boldsymbol{P}_n - \boldsymbol{P}_{n-1})$$

#### **3. Convex Hull Property**

5.6. Influence of the weights

### **Bézier surface**

## Bézier surface

Bézier surface:

$$S(u,v) = \sum_{i=0}^{n} \sum_{j=0}^{m} P_{ij} B_{i,n}(u) B_{j,m}(v), \quad 0 \le u, v \le 1$$

where  $B_{i,n}(u)$   $\exists B_{j,m}(v)$  Bernstein basis with n degree and m degree, respectively,  $(n+1) \times (m+1) P_{i,j}(i=0,1,...,n; j=0,1,...,m)$  construct the control meshes.
