The workflow of digital media analysis and retrieval

3. Video retrieval techniques

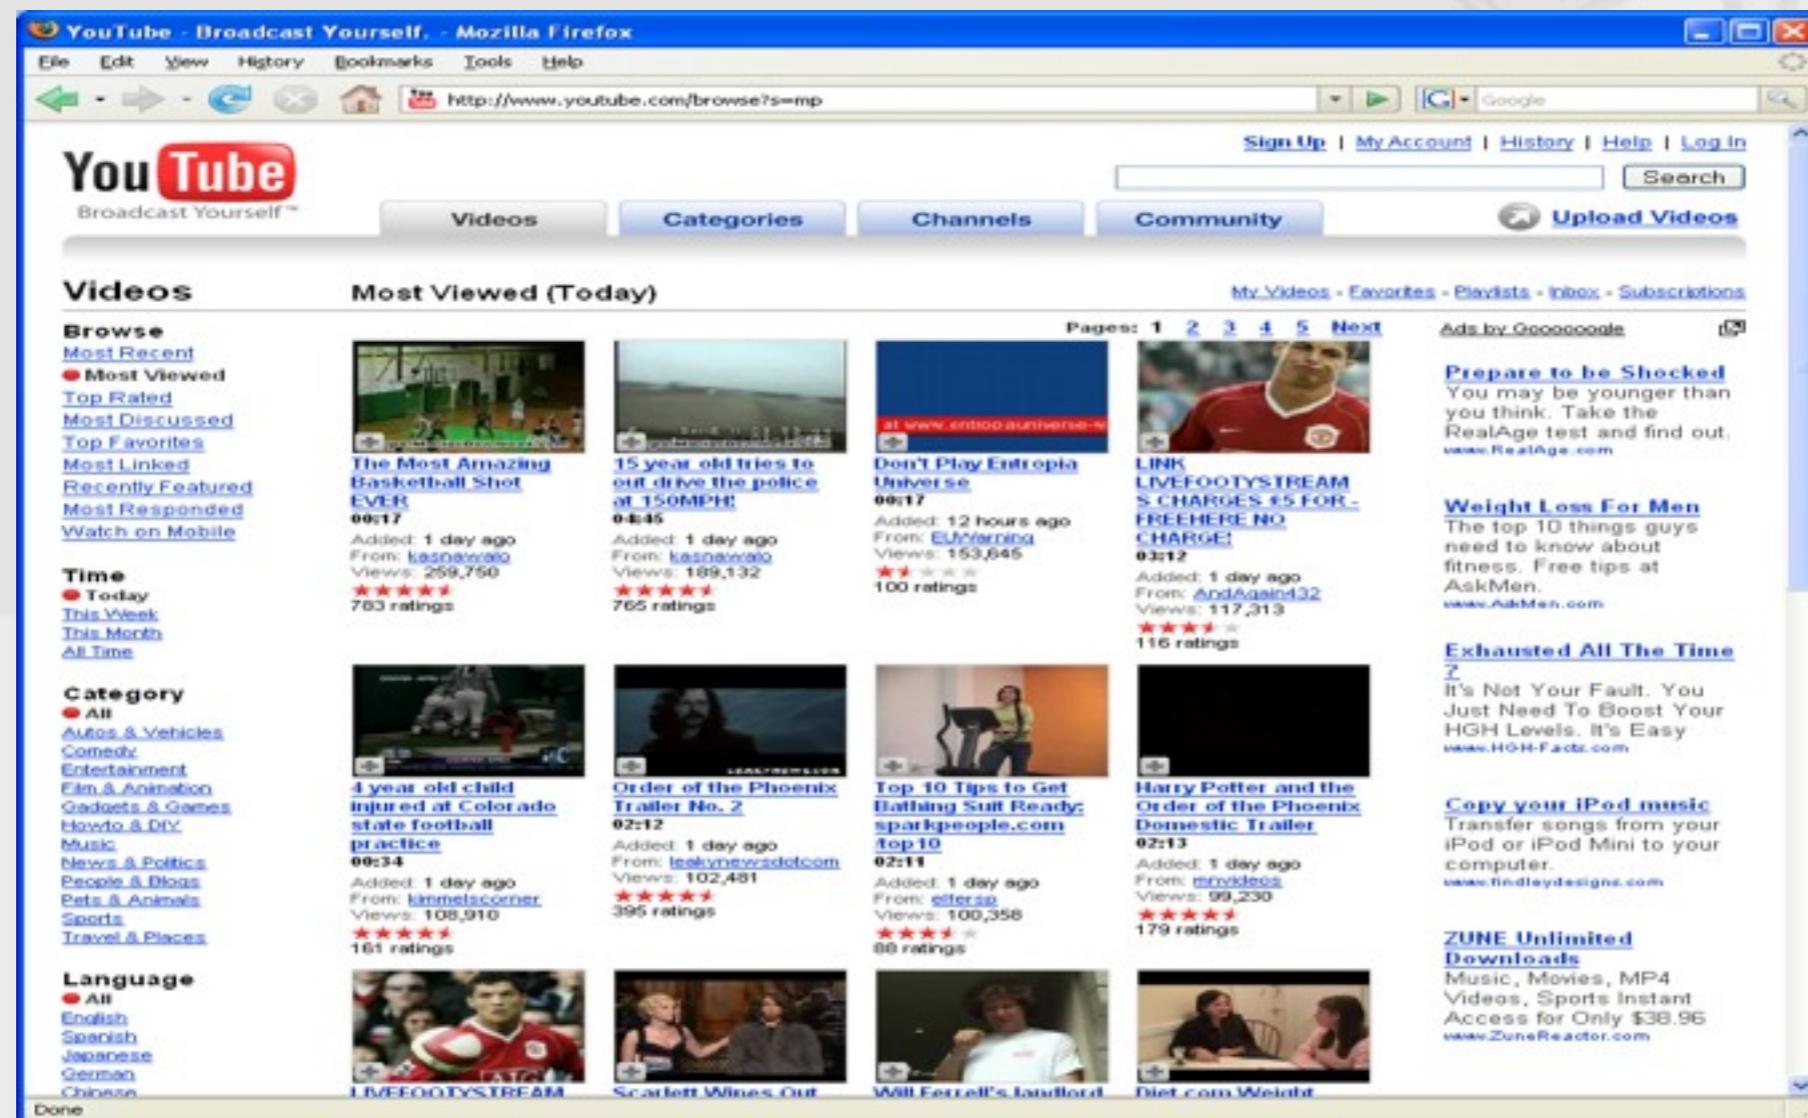

Differences and relations between image and video

- Images are **static**, but video are **dynamic**.
- Video stream can be viewed as sequence of image frames.

CBVR

- Sample YouTube Video page:

Main methods of digital media retrieval

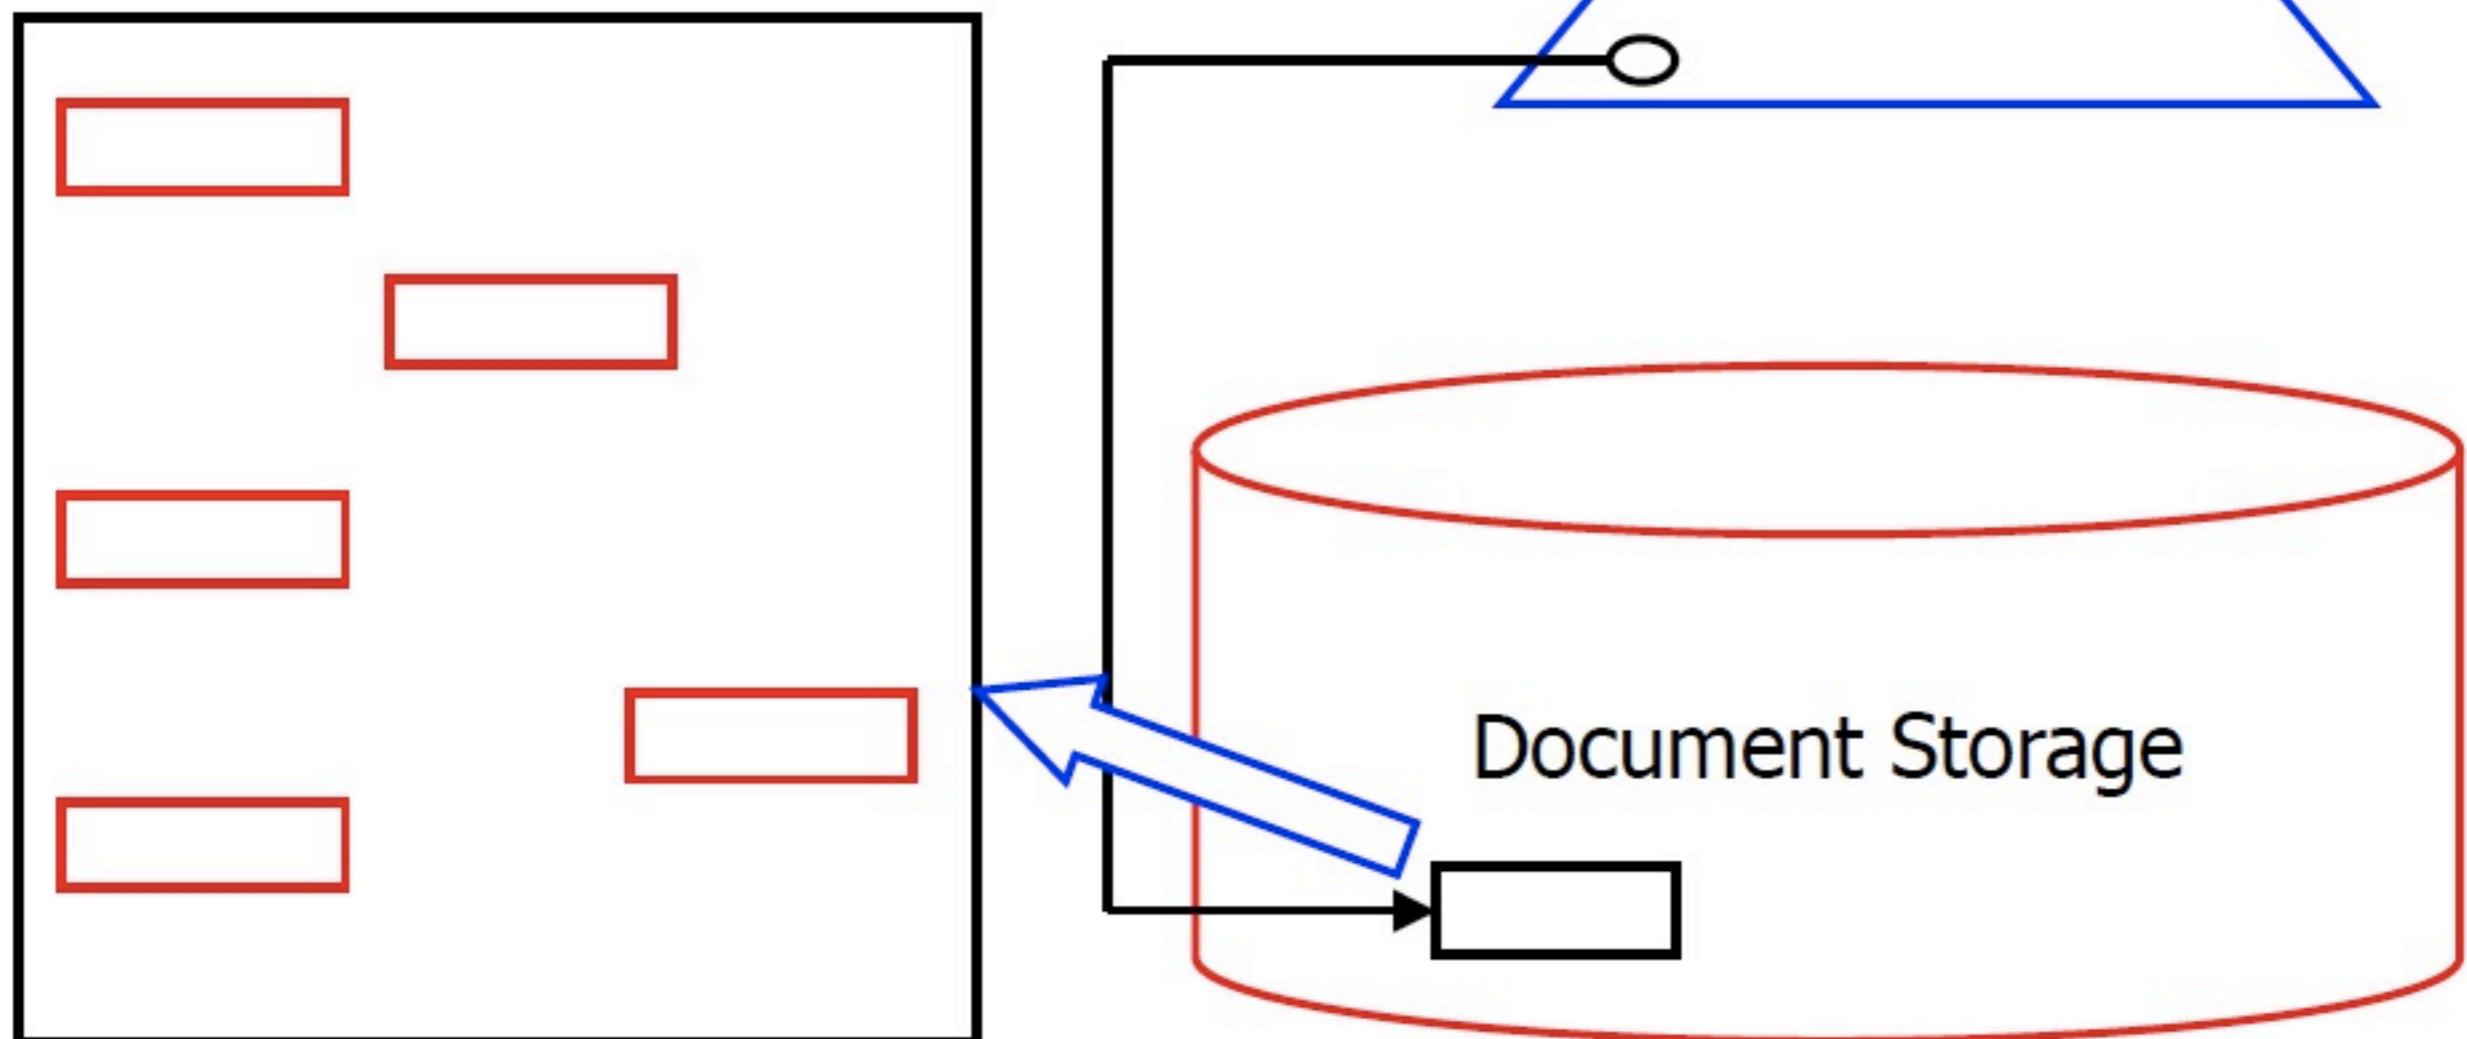

- **Text-based** digital media retrieval

- **Content-based** digital media retrieval

Why we need video shots?

a. **Text Retrieval**: Keyword Extraction

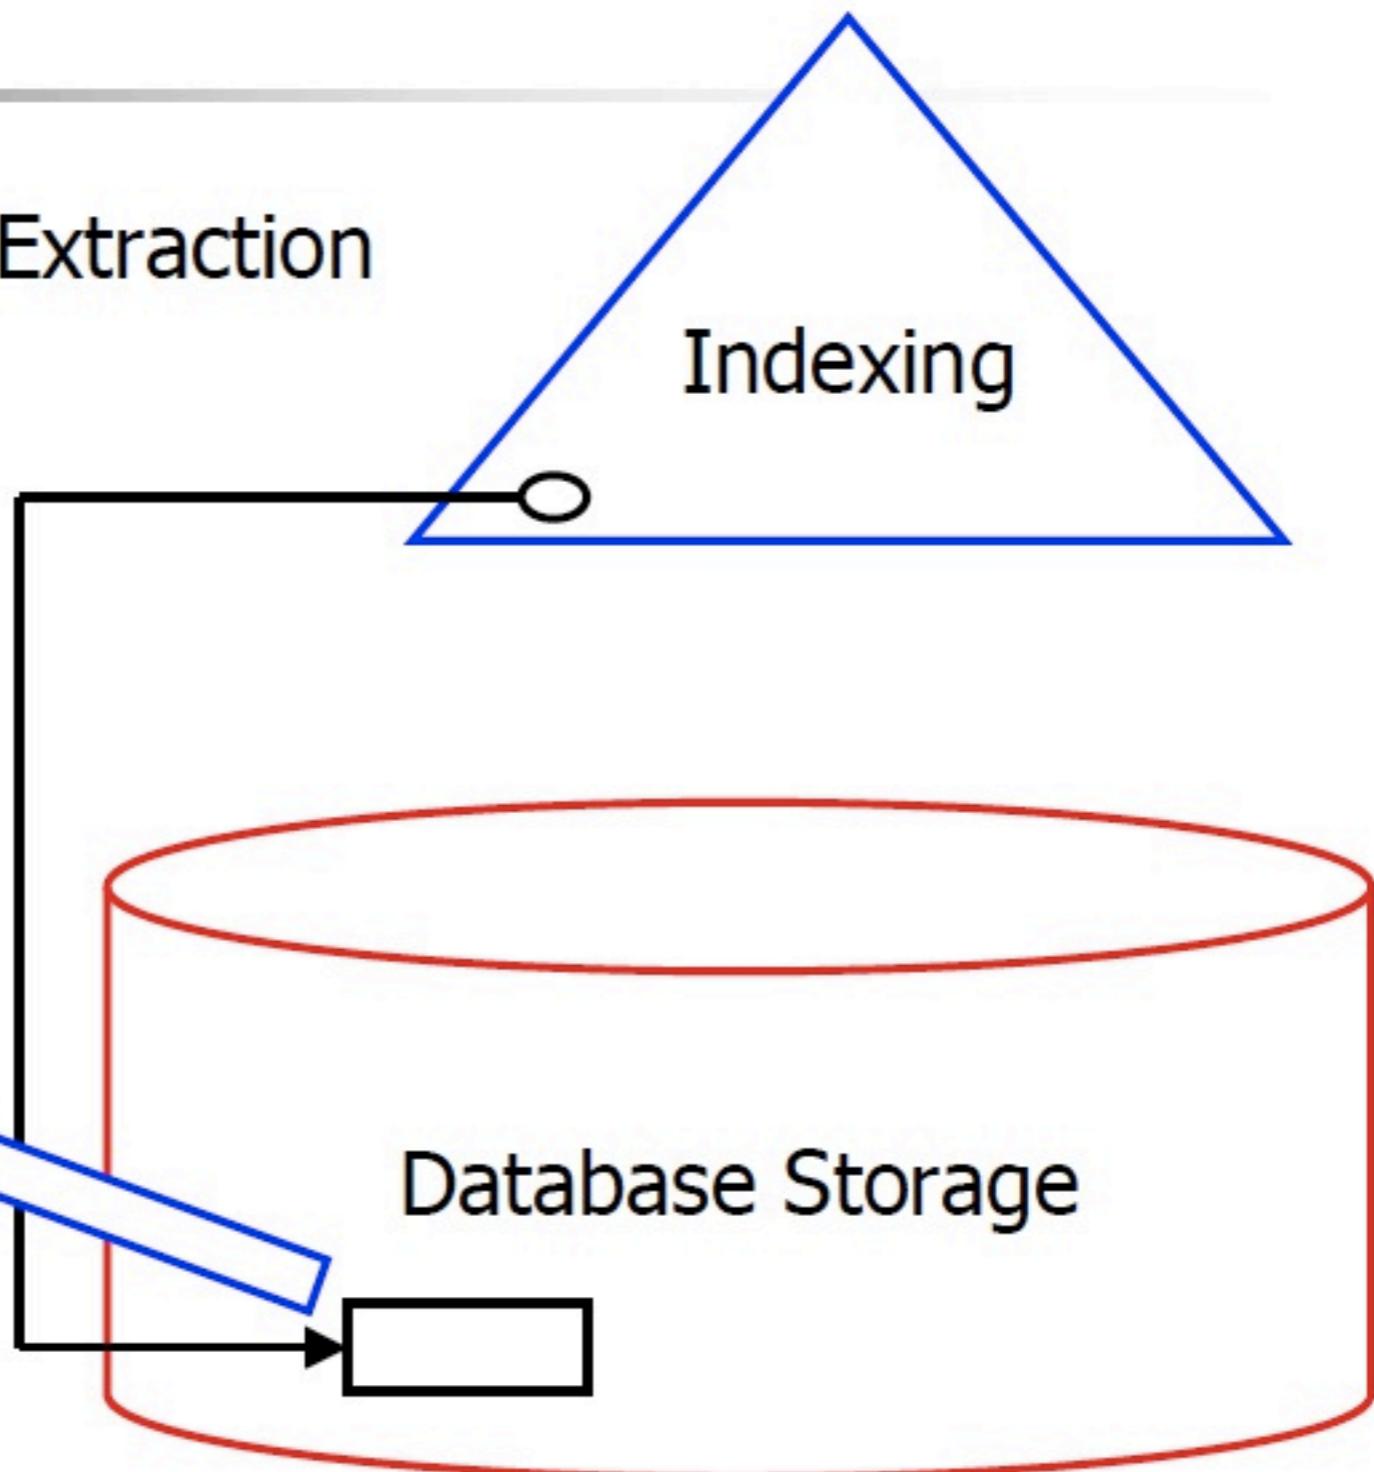

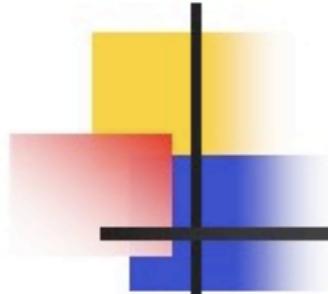

Why we need video shots?

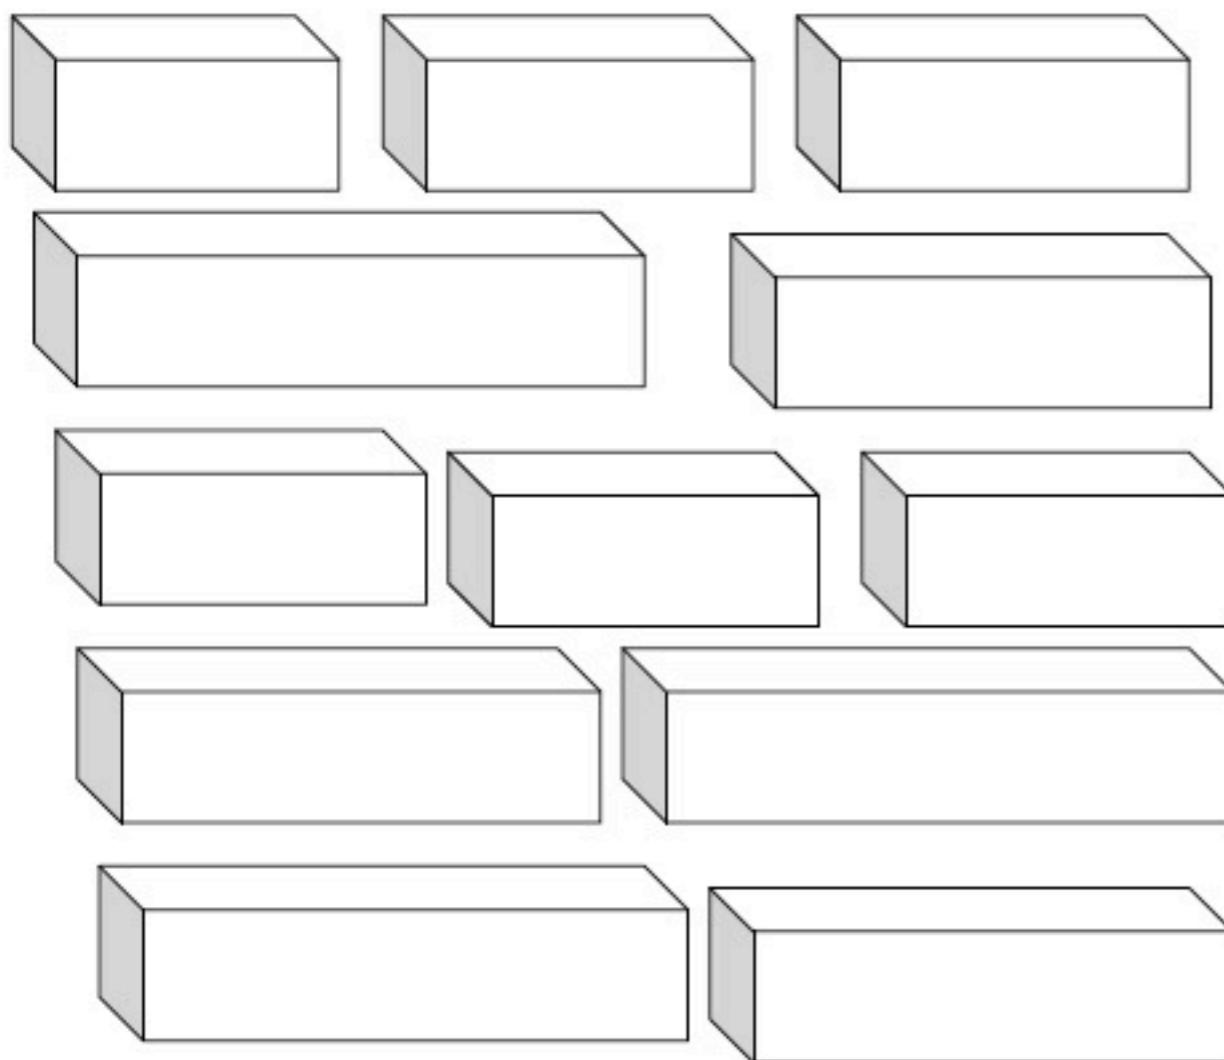

b. Database Query: Entity Extraction

sid	name	login	age	gpa

53650	Smith	smith@math	19	3.8

Why we need video shots?

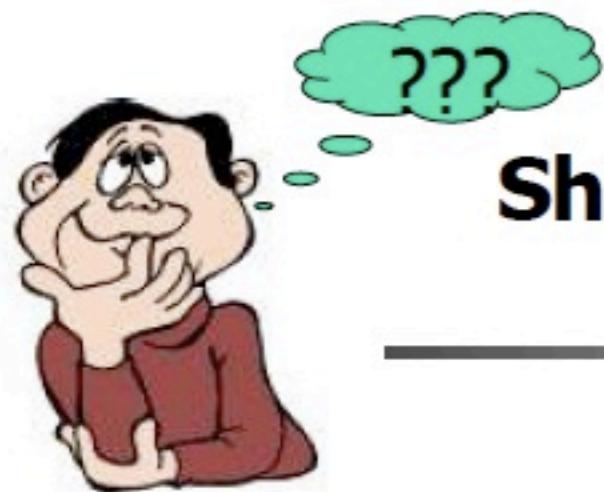

Indexing

Shot Indexing

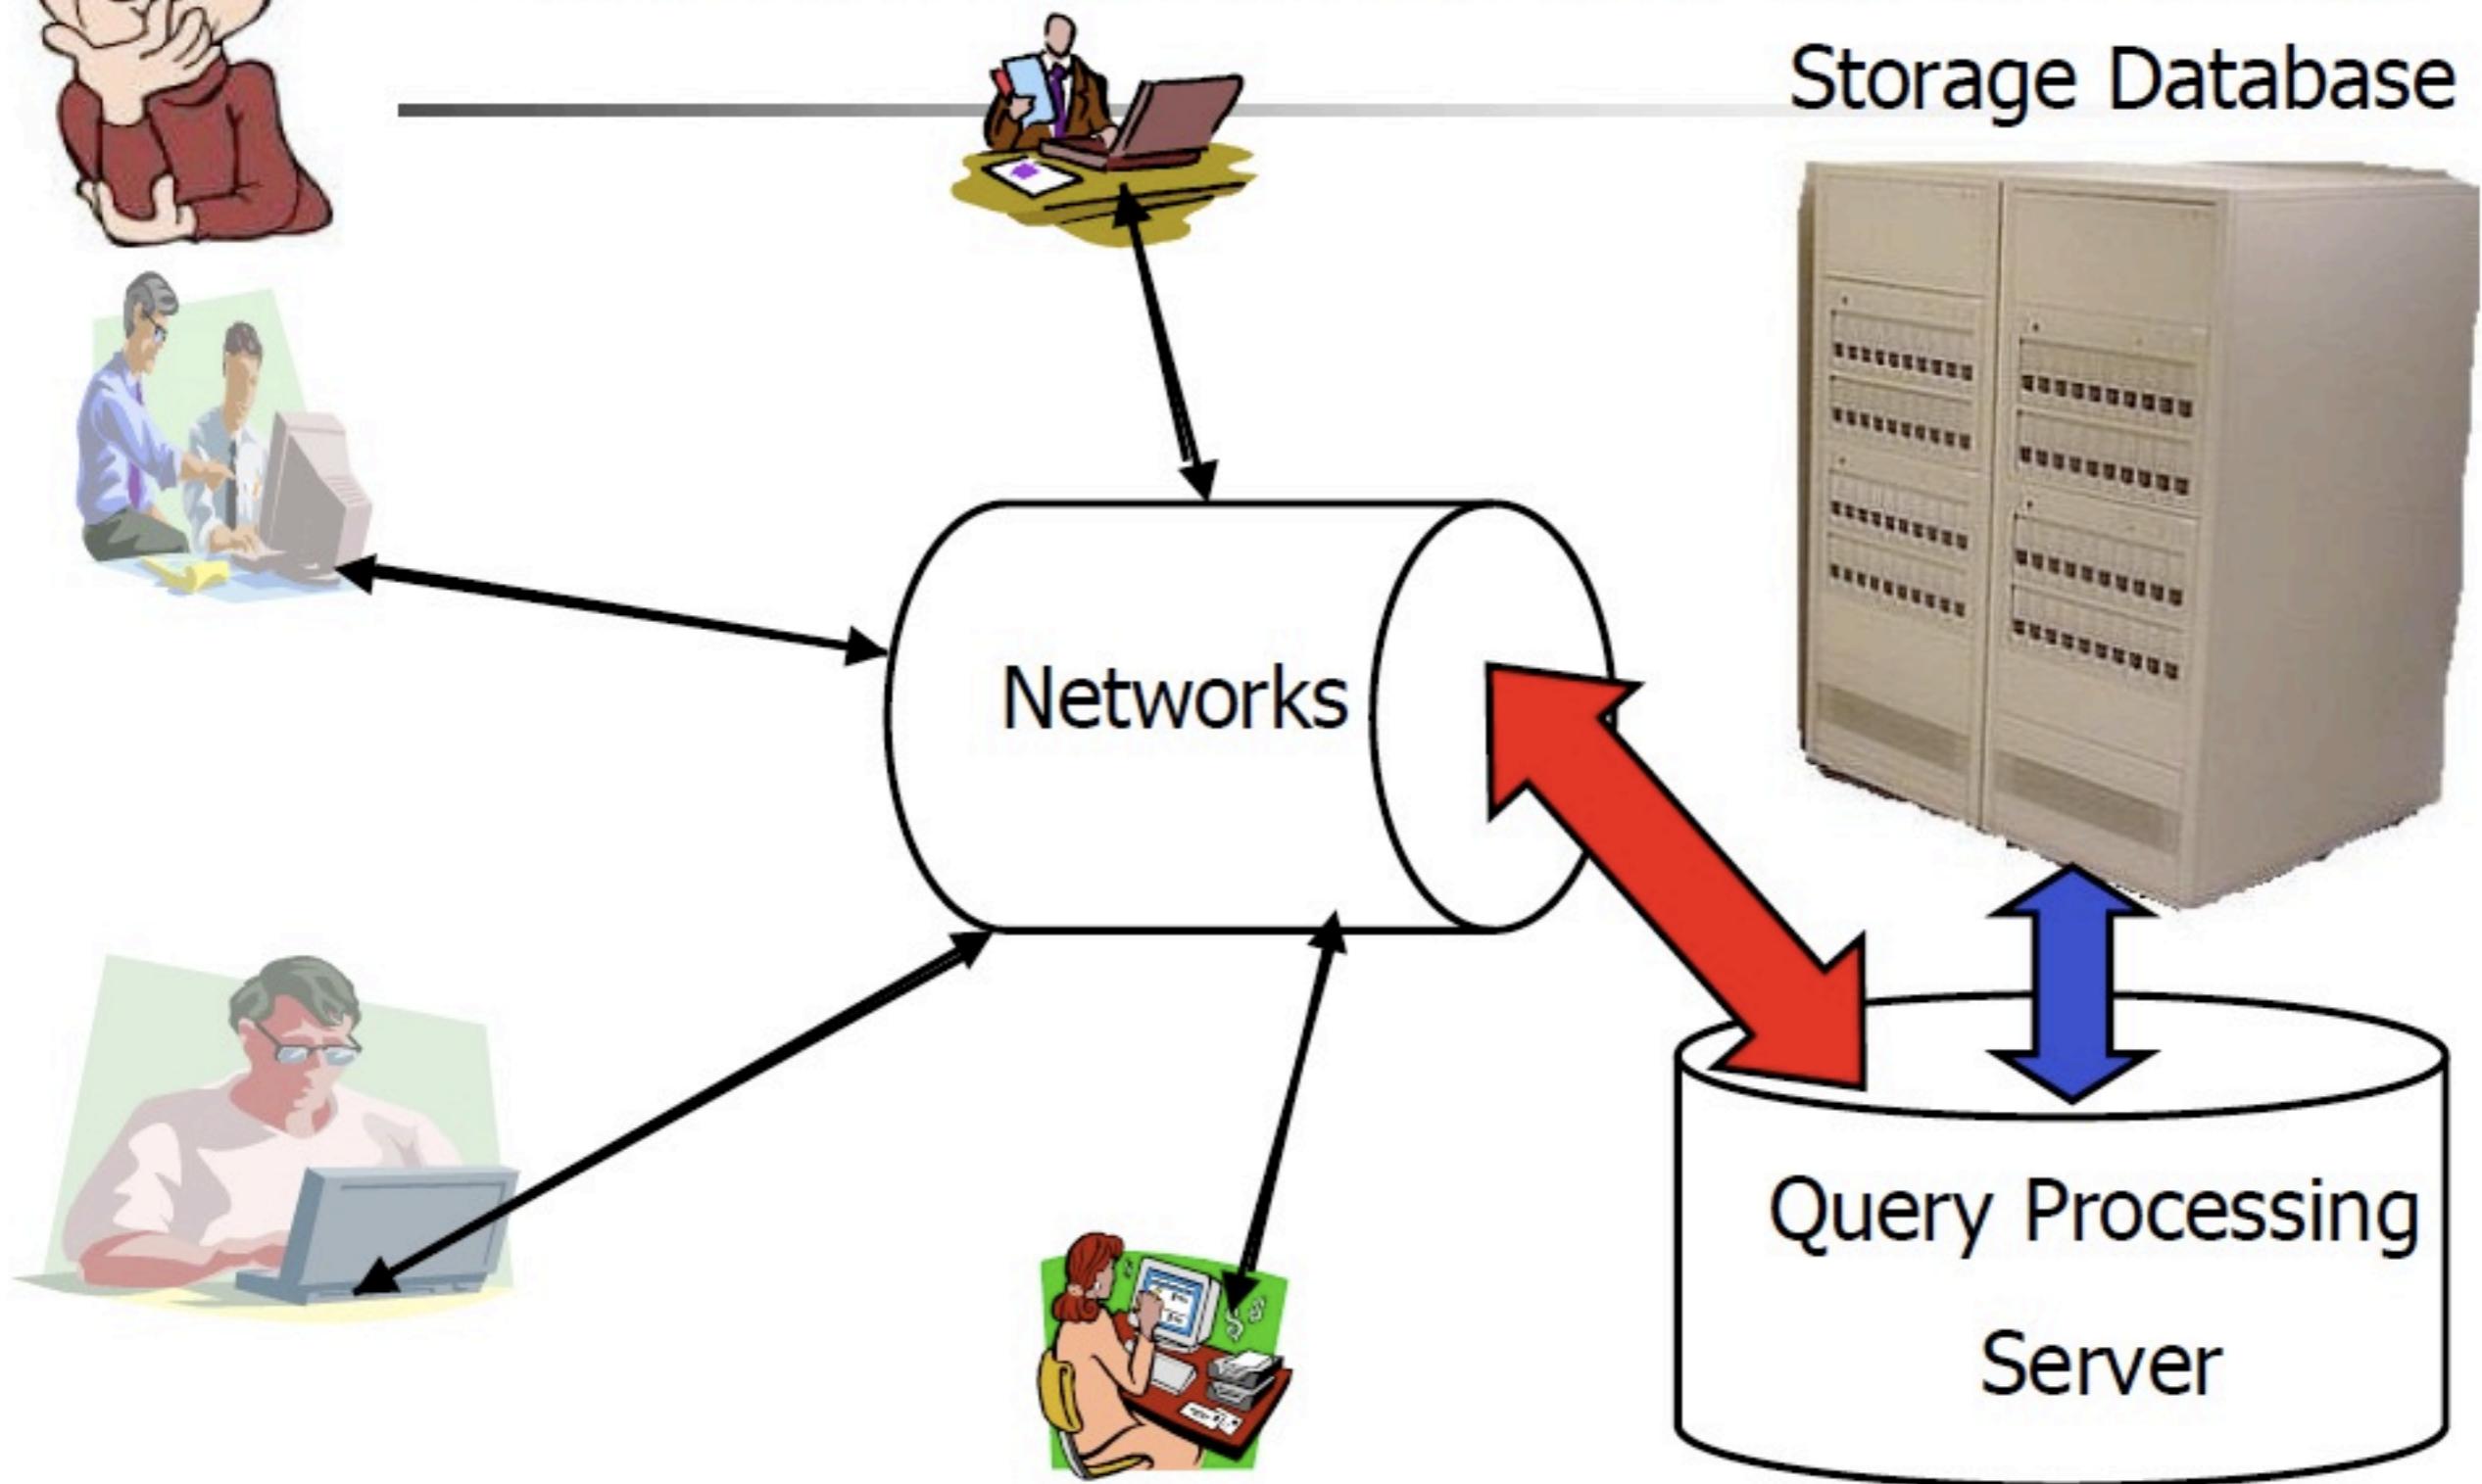

Video Shots in Storage

Video shot =?= keyword in video?

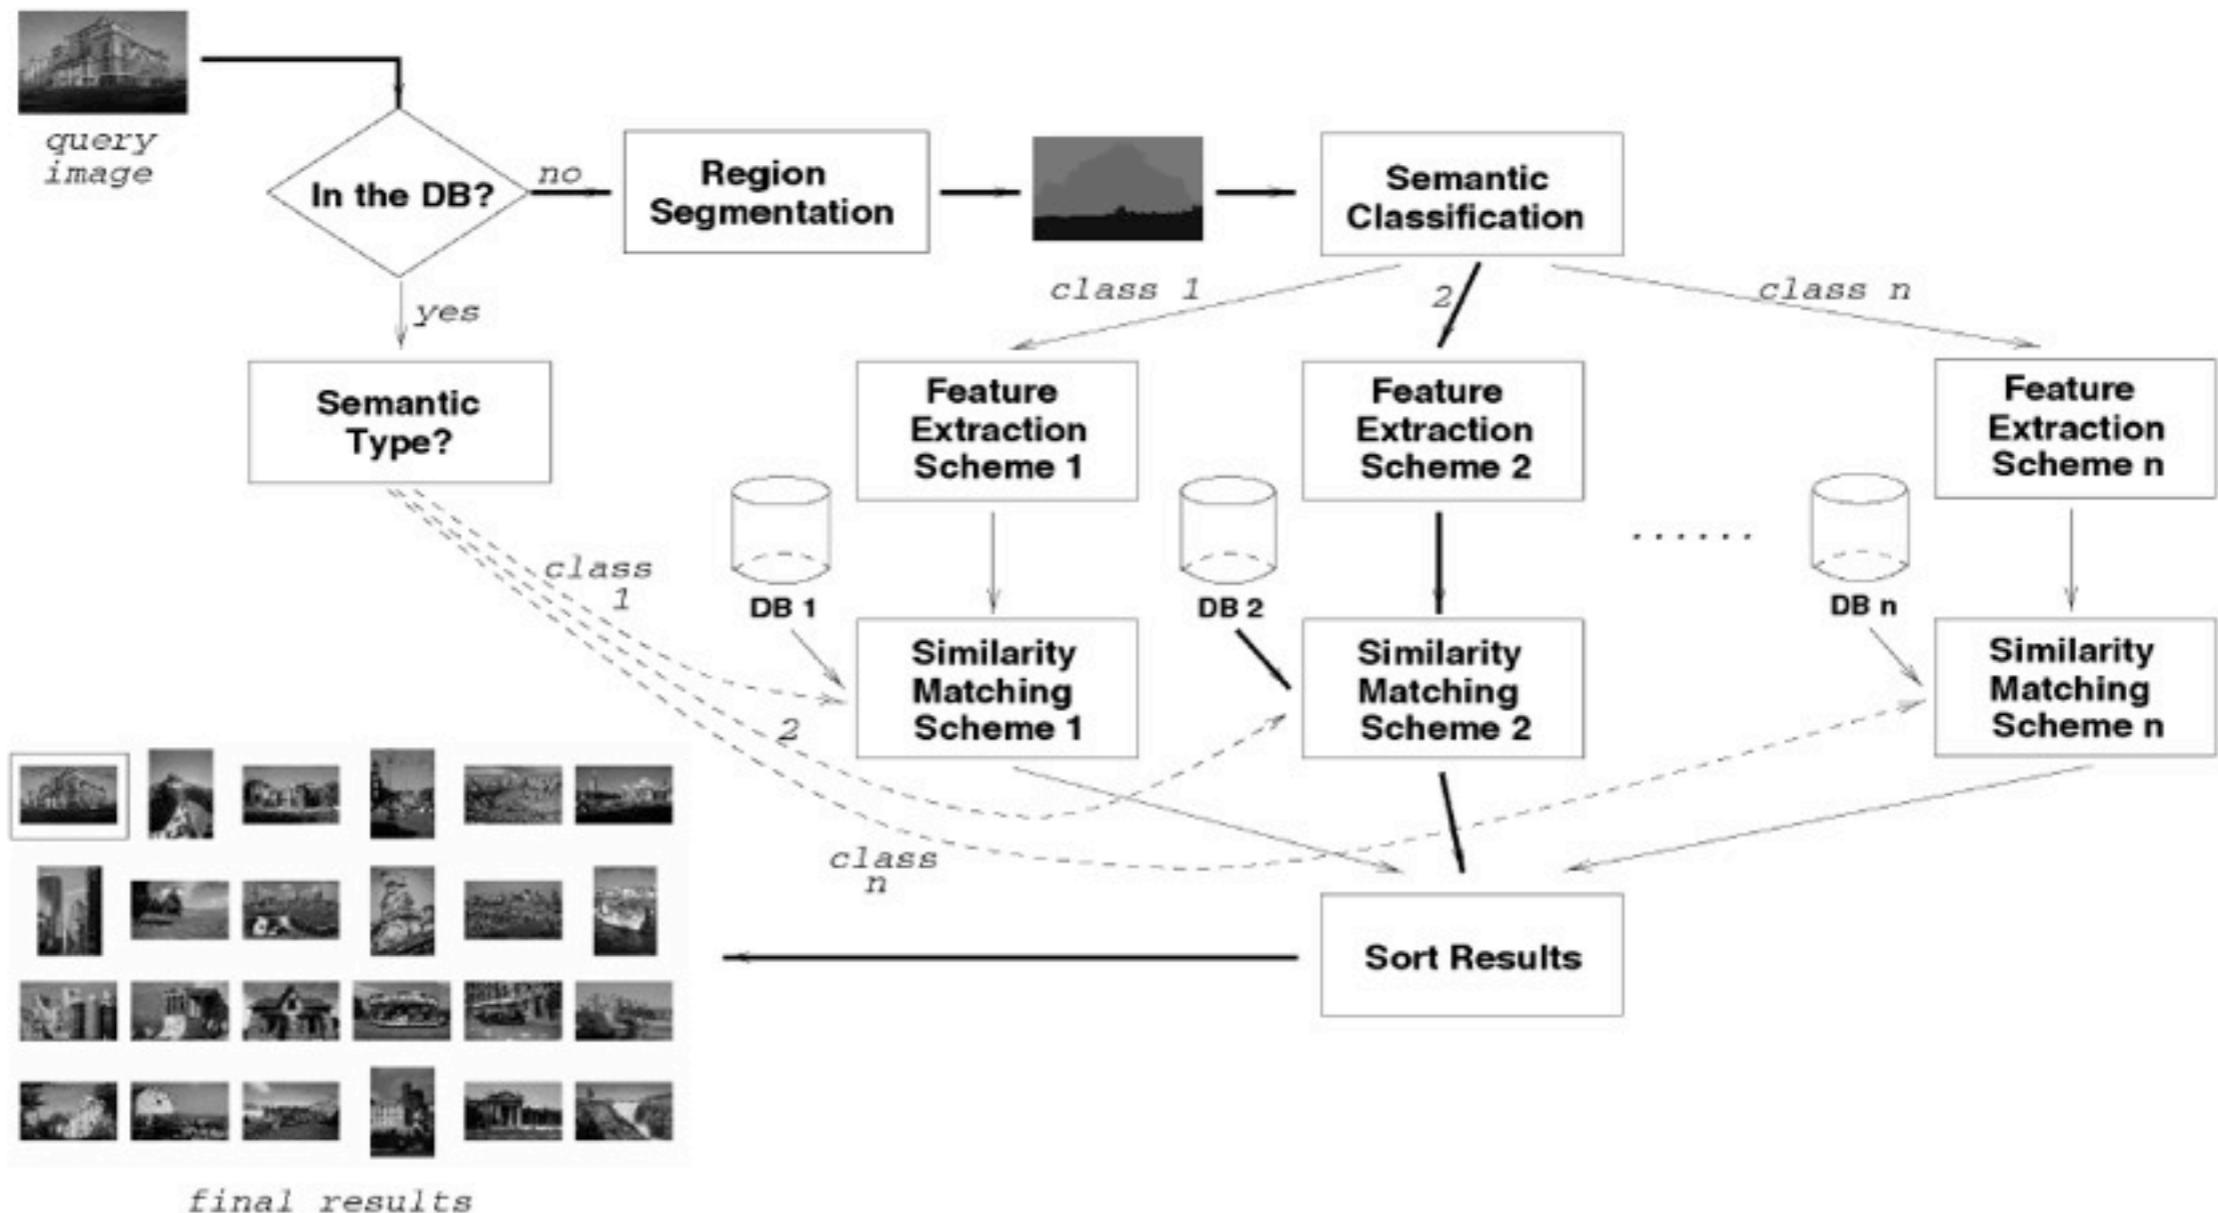

Shot is used as basic unit for video indexing!

Overview

- CBVR has two phases:
 - Database Population phase
 - Video shot boundary detection
 - Key Frames selection
 - Feature extraction
 - Video Retrieval phase
 - Similarity measure

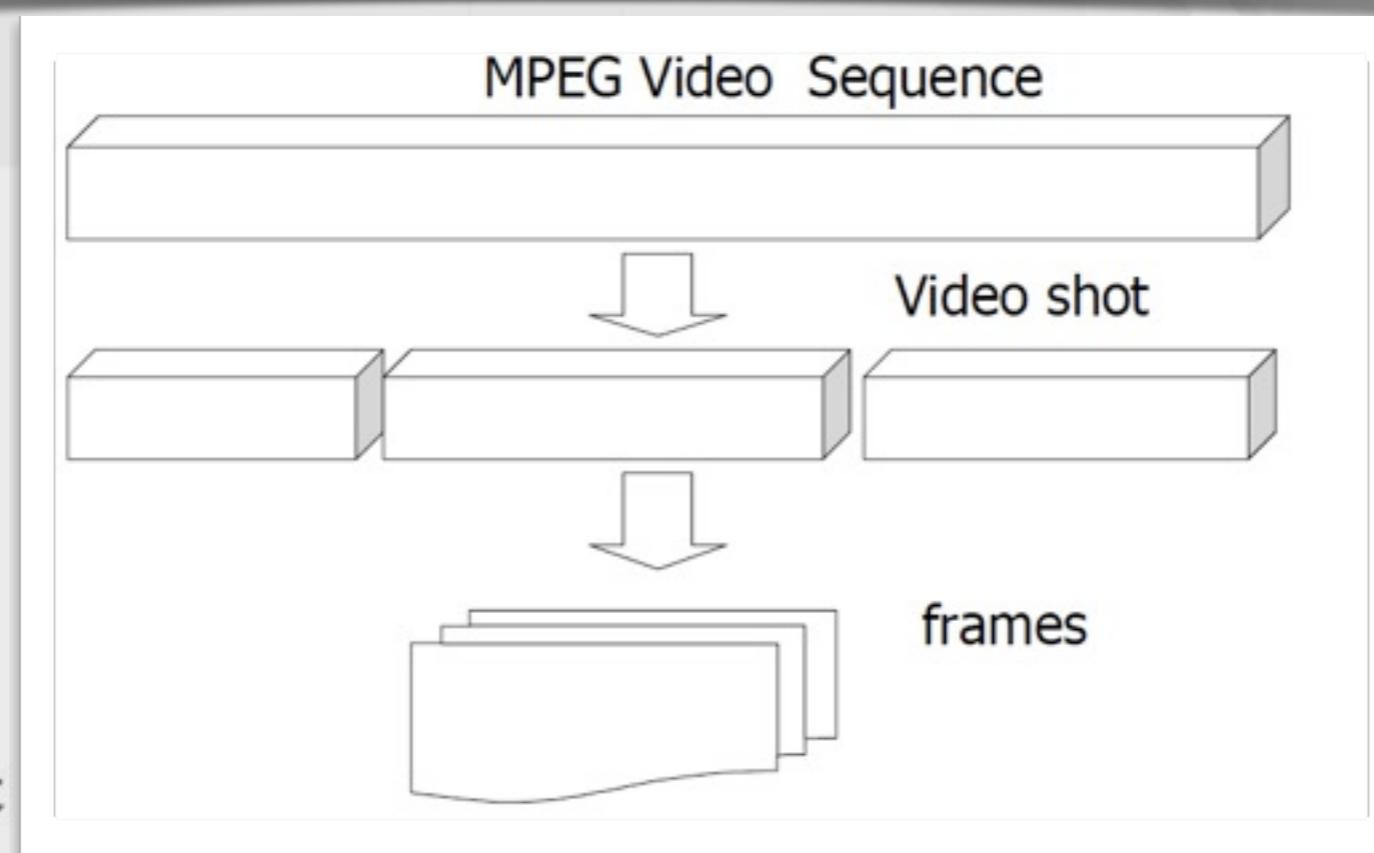

Overview (cont.)

[Wang, Li, Wiederhold, 2001]

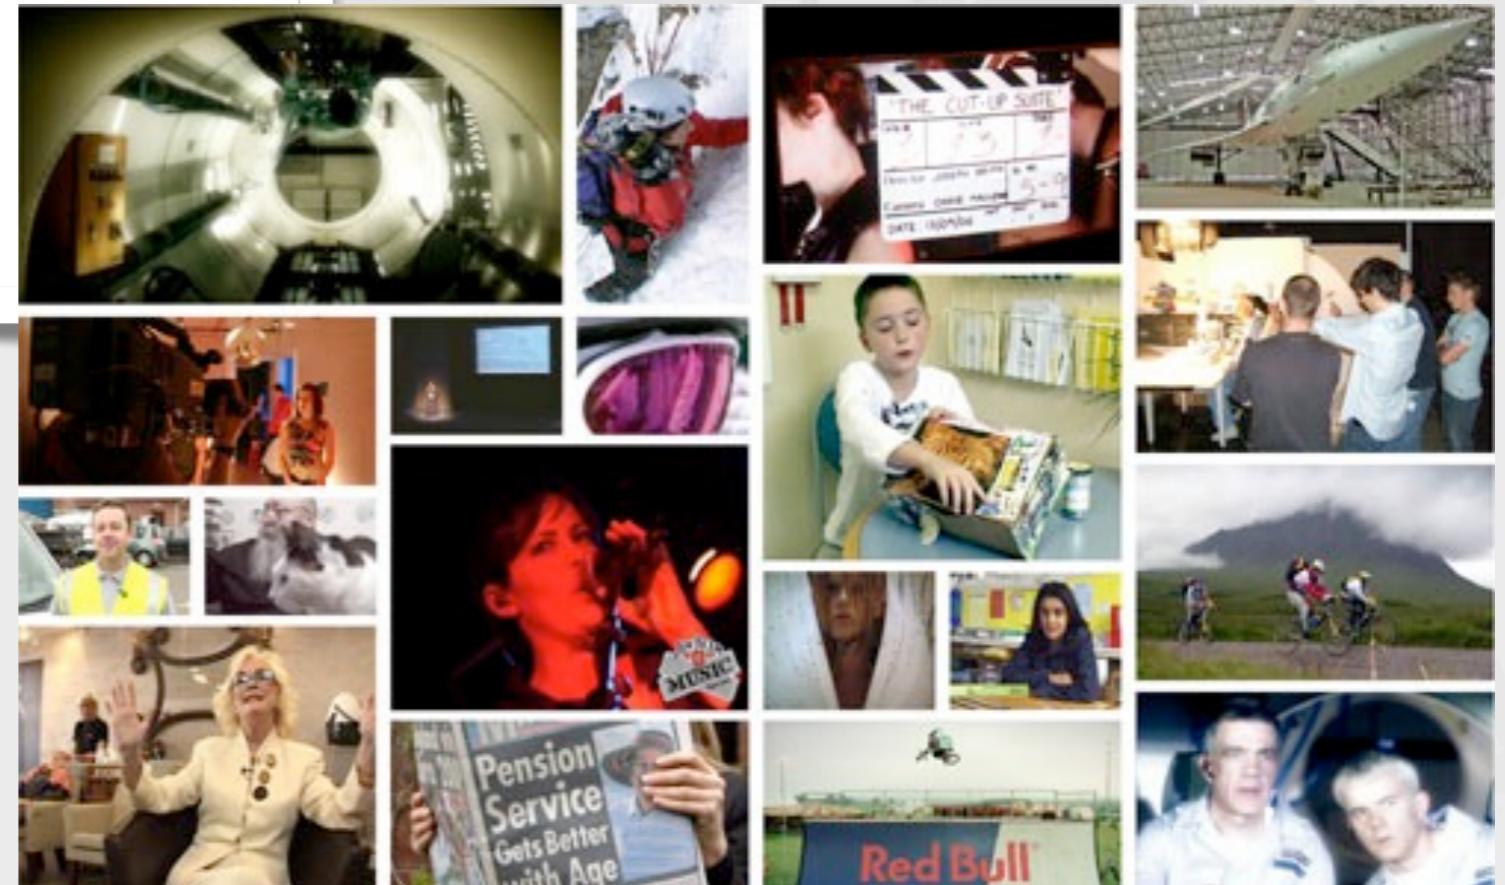

Structuralizing video data

- **semantic content layers**, e.g., scenes and shots in a video program.
 - These layers are erased when they are displayed for audience, which weakens the ability for user dealing with raw video data.

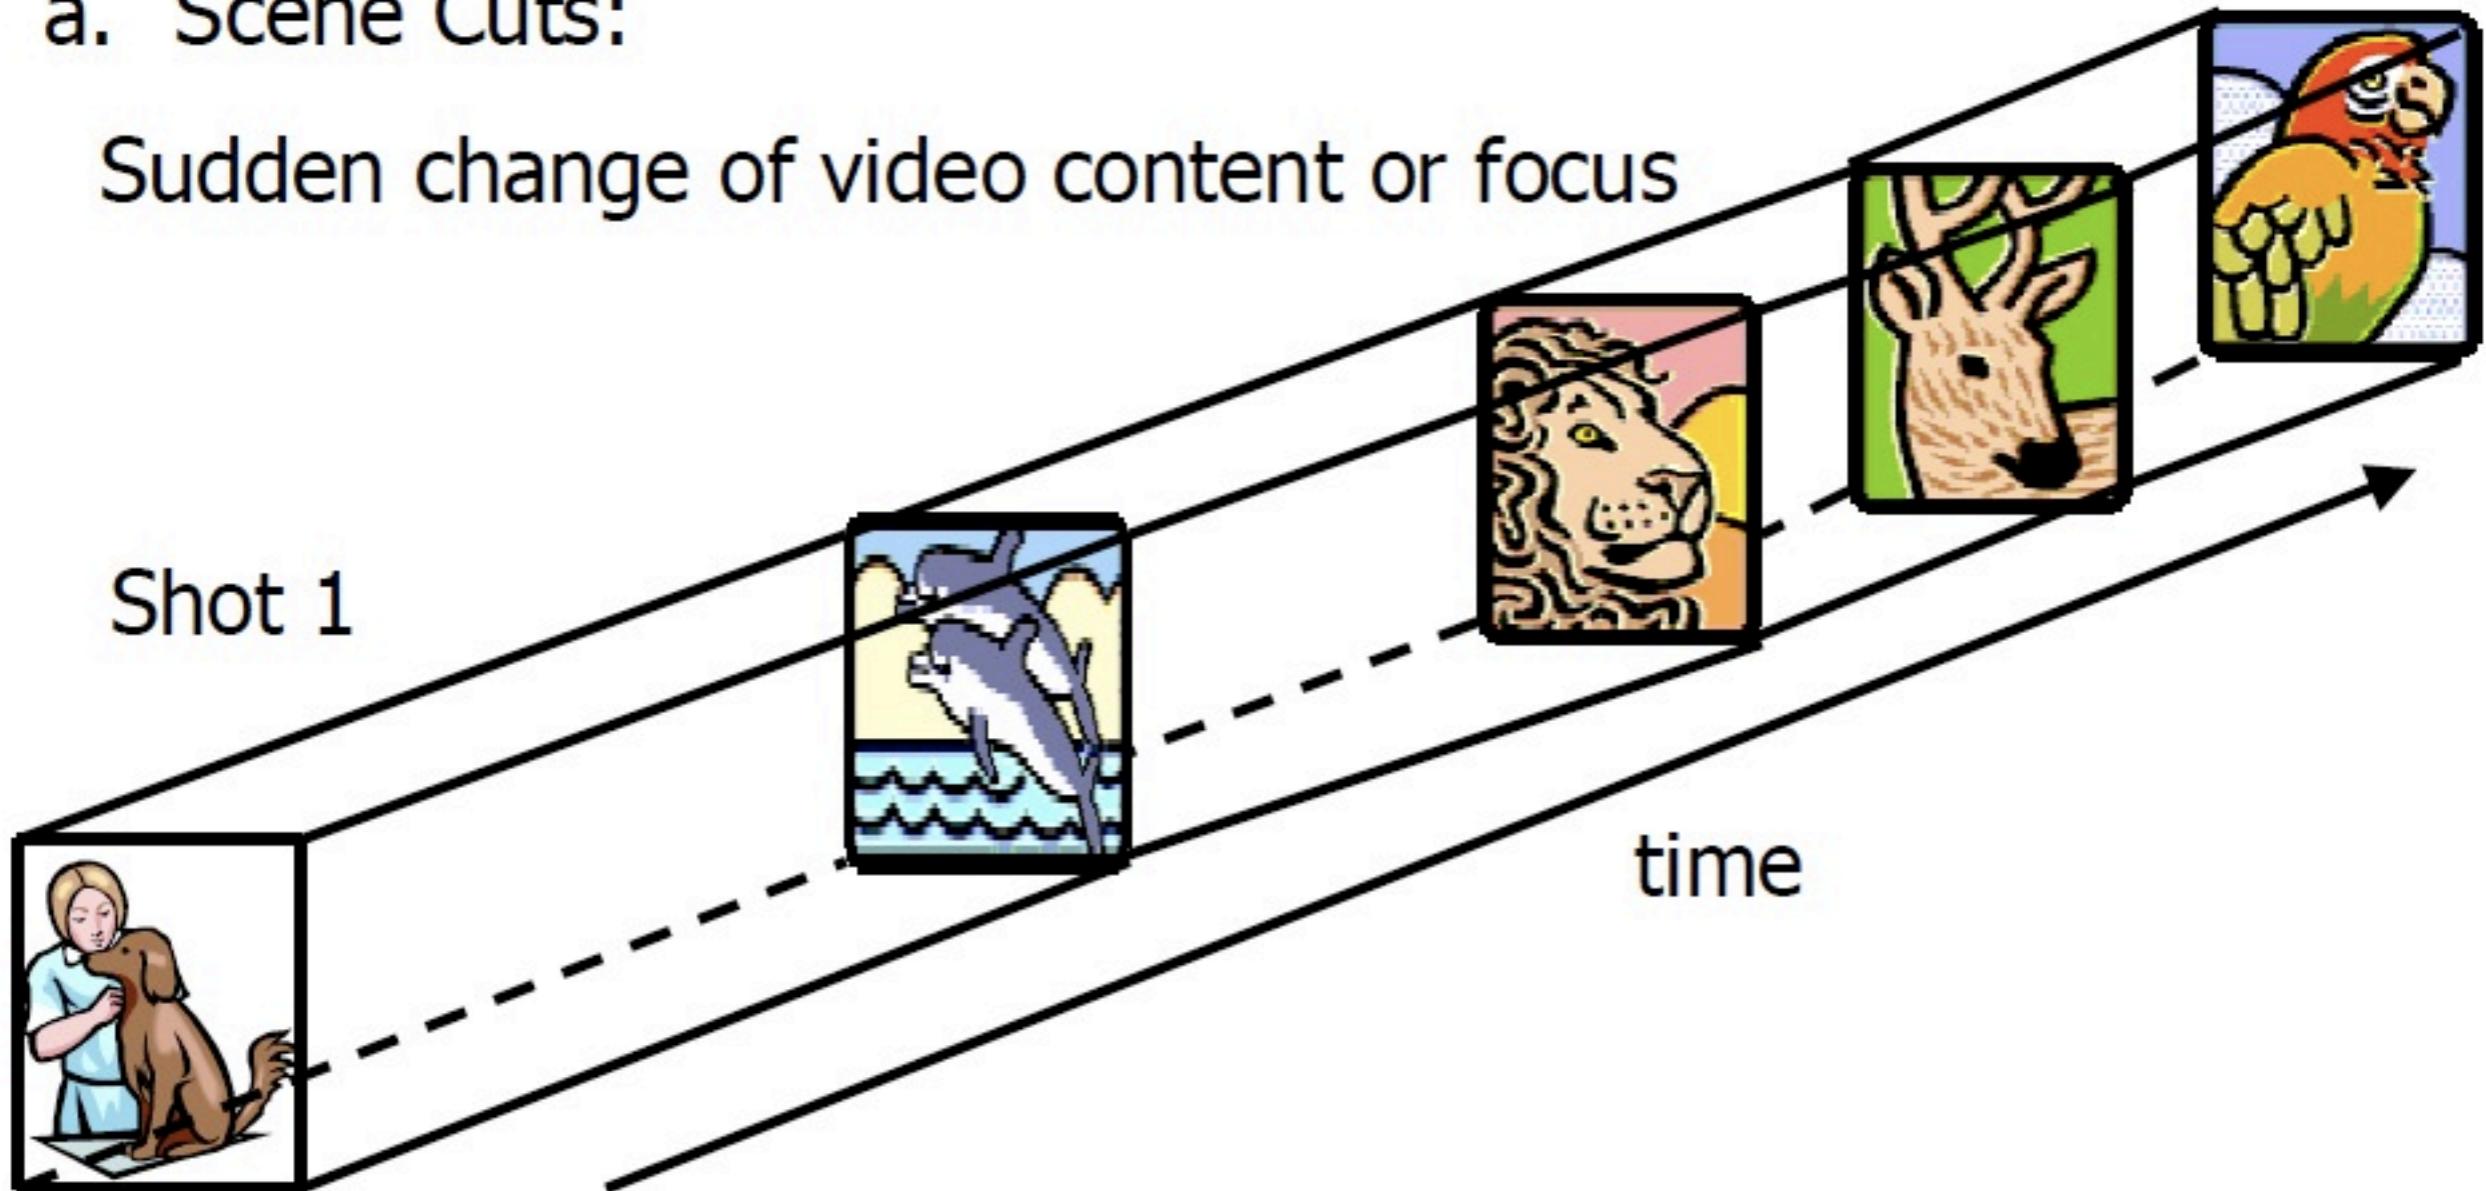

Fundamental definitions in video structurization

- Frame (帧)
- Shot (镜头)
- Key frame (关键帧)
- Scene (场景)
- Group (组)

a. Scene Cuts:

Sudden change of video content or focus

Proposal

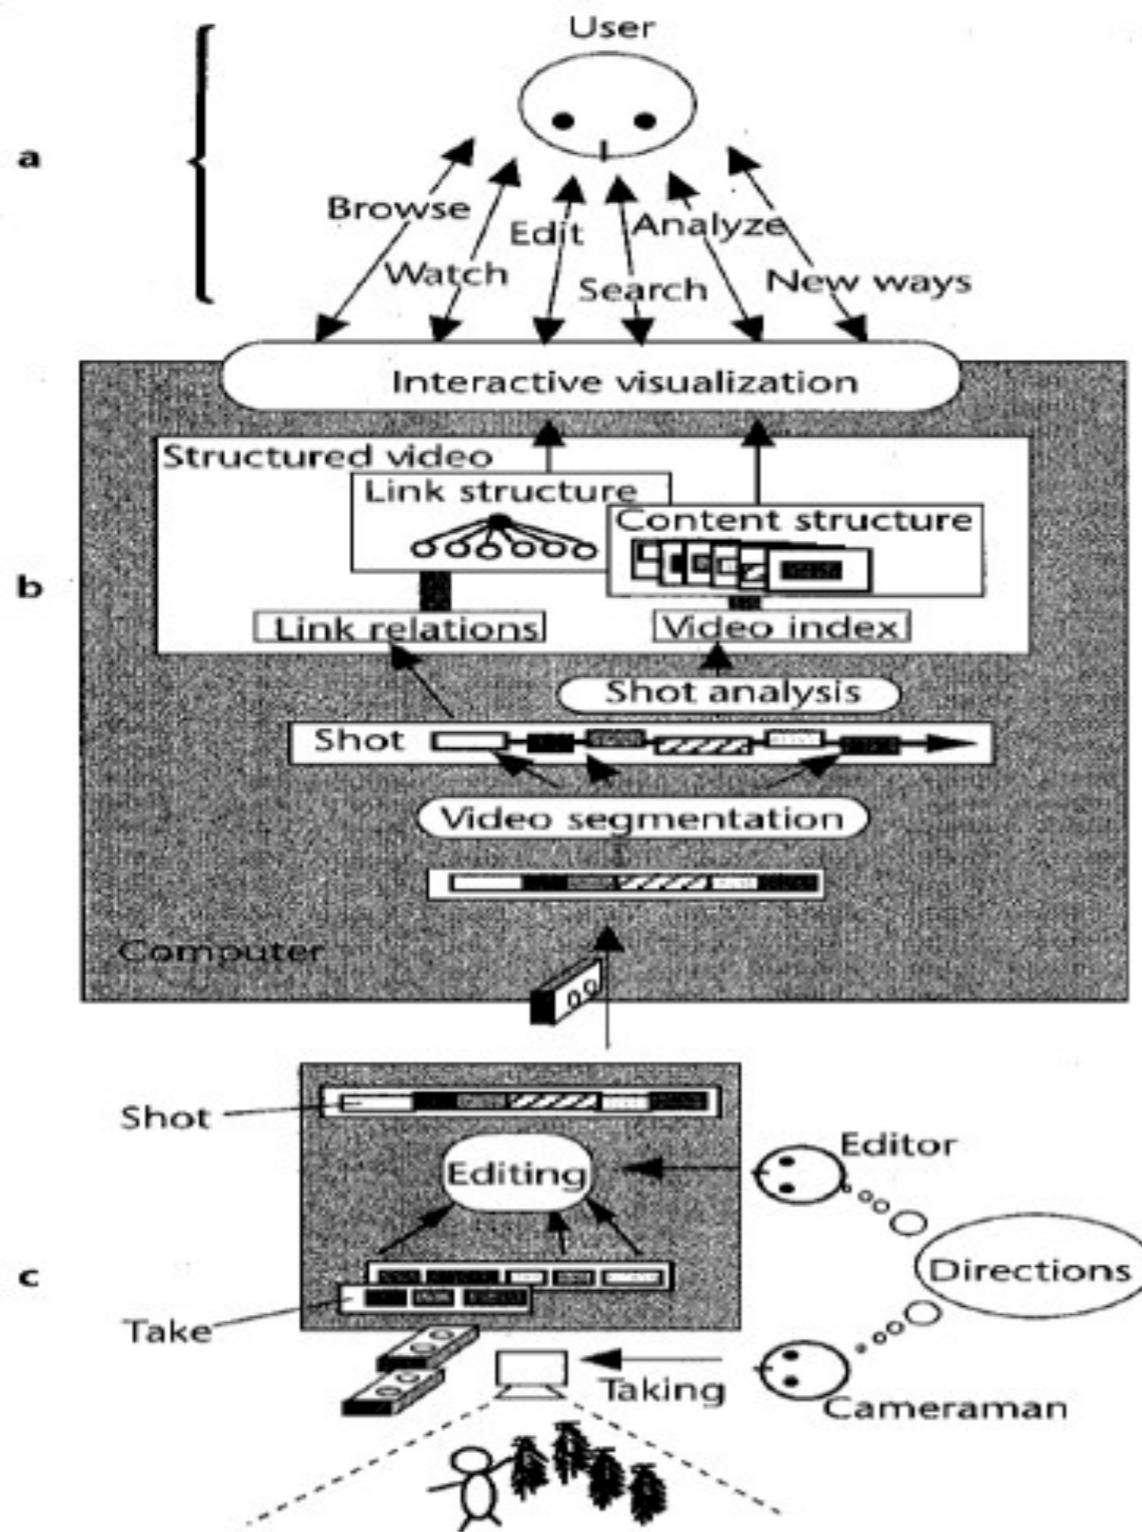

- Analyze a video stream
- Segment the stream into shots
- Index shots using extracted features
 - Camera work characteristics (Long, Middle, Short ...)
 - Color representations
- Browsing methods and user interfaces

Desired Video Interaction

- Focus on fast visual browsing.
- Ability to grasp idea of lengthy video in short time.
- Not simply fast forward.
- Challenge: find and manage essential visual cues, then present them visually in an effective way

Viewer-Video Interaction: Conceptual Model

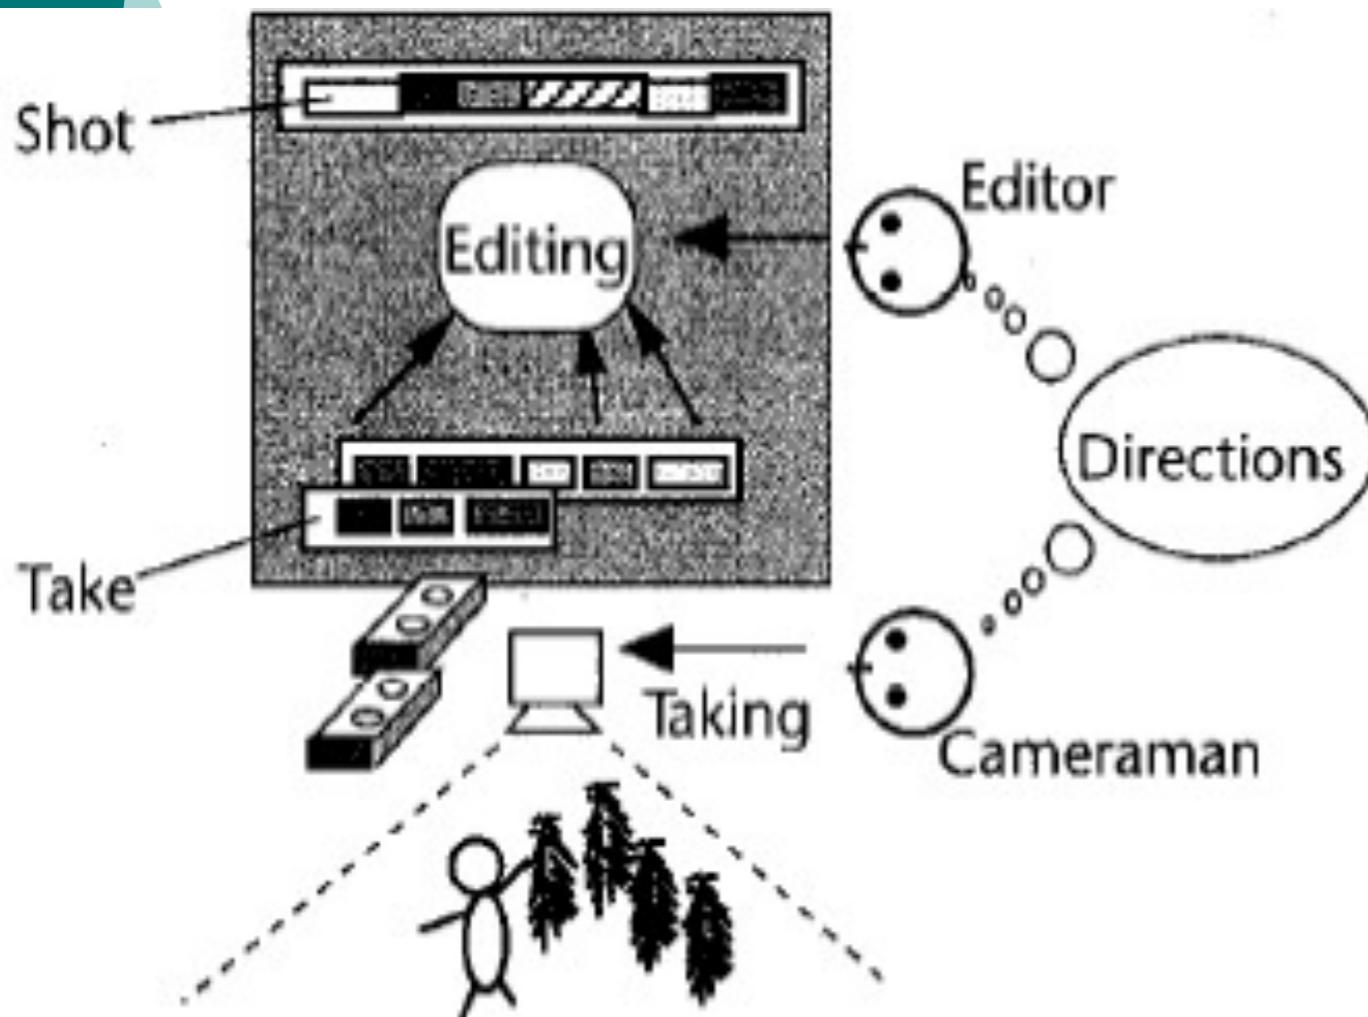

a) Viewer Interaction

b) Video Computing

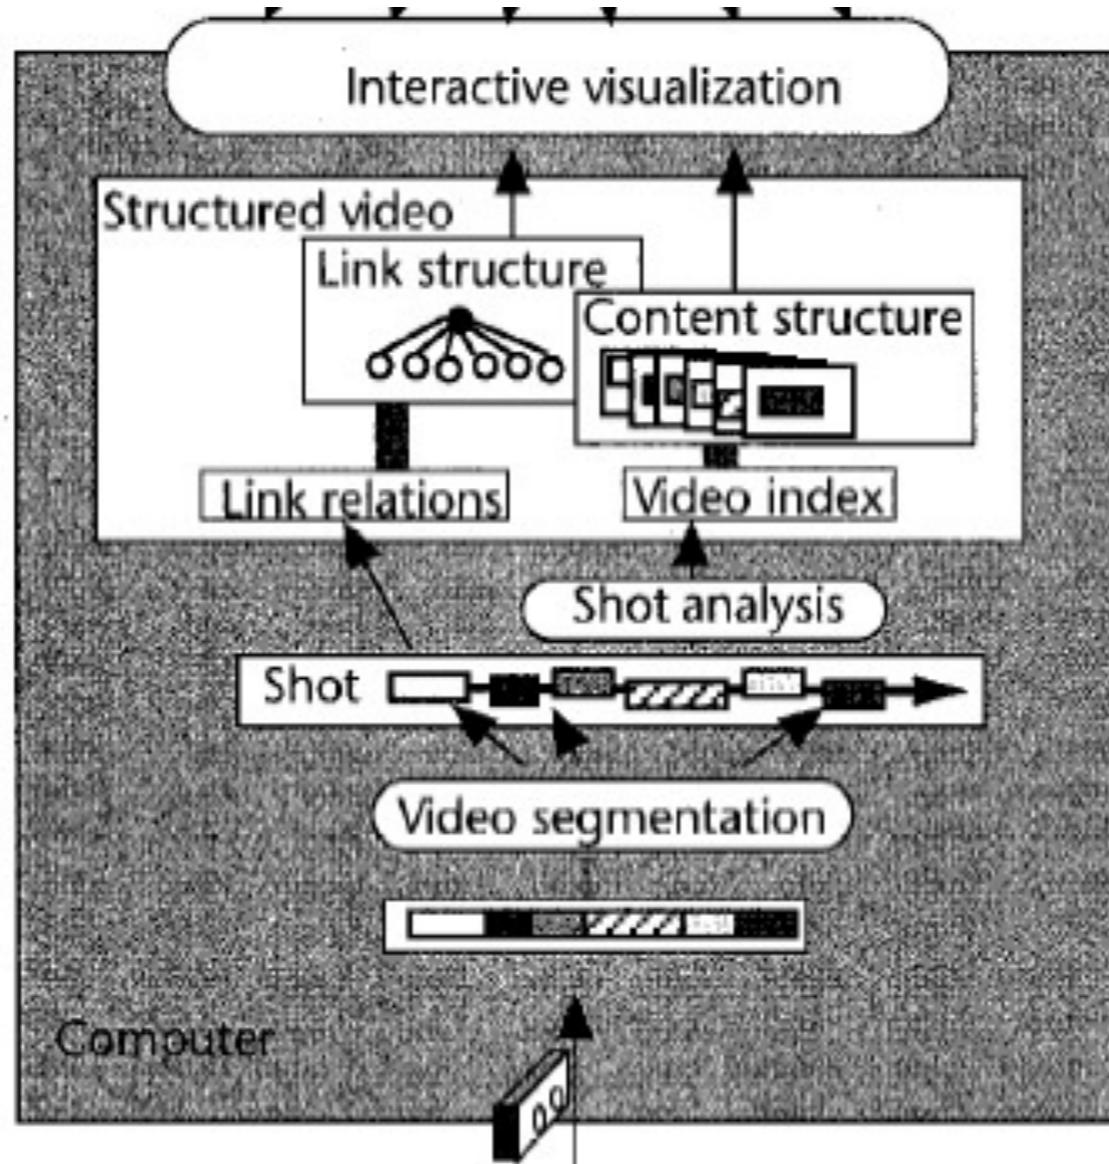

c) Video Production &
Editing

Video Production

- Key Concepts:
 - Take: continuous video
 - Cut: separates takes
 - Camera characteristics
 - Pan, tilt, zoom, etc.
 - Shot: edited takes
- Resulting video contains embedded info: cut points, camera characteristics

Video Computing

- Main Function: Make the implied video structure explicit.

Video Segmentation: Problems

- Traditional Cut Detection – detect differences between frames using inter-frame comparisons (intensity, RGB, motion vectors).
- Mis-detection due to rapid object motion, slow motion, animation, strobes, fading, wiping, dissolving, etc.
- Result: Low successful detection rate.

Basic video segmentation metrics

- Pair-wise comparison
- Pixel-level
 - Sensitive to camera movement and motion
- Block-level (Likelihood ratio)
- Can tolerate small motion

$$DP_i(k, l) = \begin{cases} 1 & \text{if } |P_i(k, l) - P_{i+1}(k, l)| > t \\ 0 & \text{otherwise} \end{cases}$$

$$\frac{\sum_{k,l=1}^{M,N} DP_i(k, l)}{M * N} * 100 > T$$

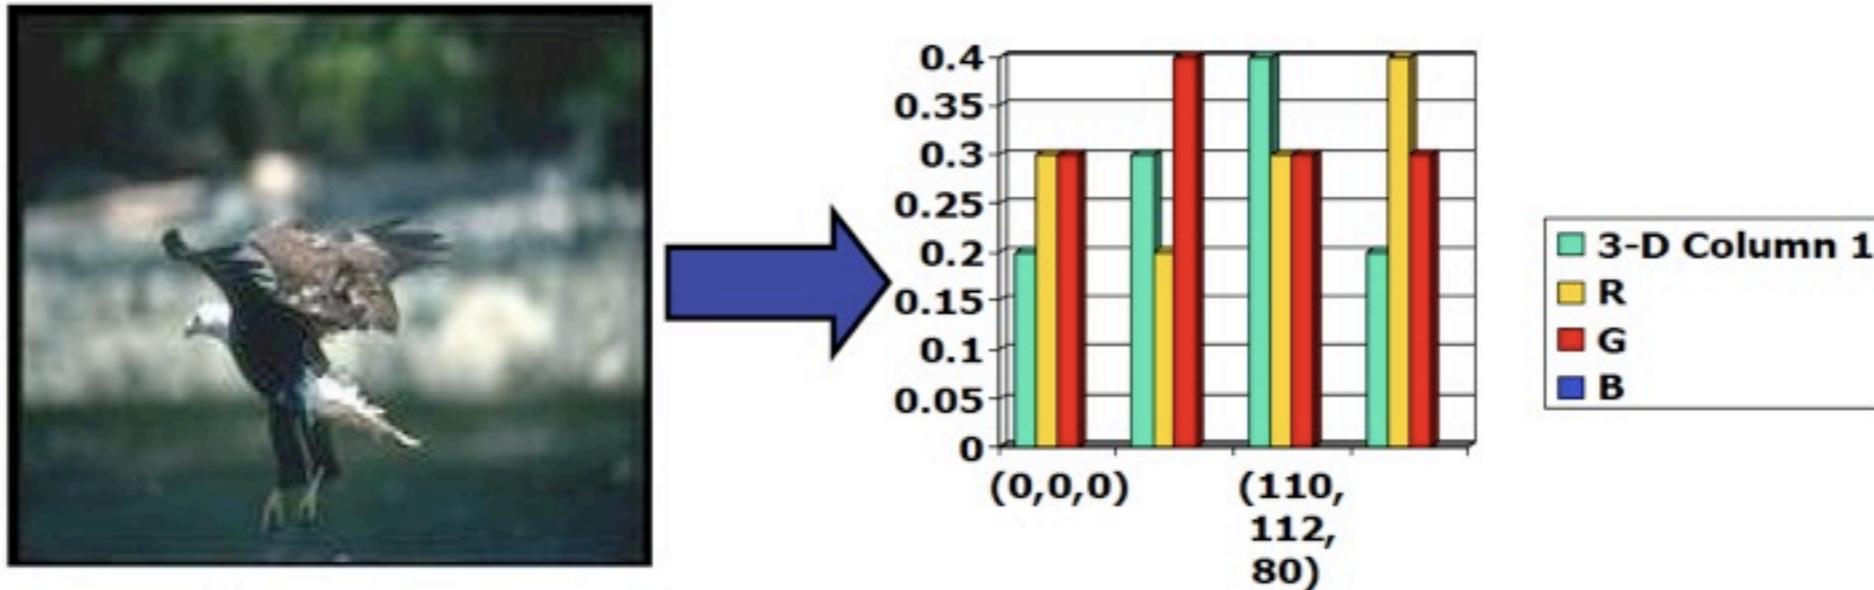

$$\frac{\left[\frac{S_i + S_{i+1}}{2} + \left(\frac{m_i - m_{i+1}}{2} \right)^2 \right]^2}{S_i * S_{i+1}} > t$$

mi: mean intensity
Si: corresponding variance

Basic video segmentation metrics

How to measure statistical property of video frames?

Color Histogram

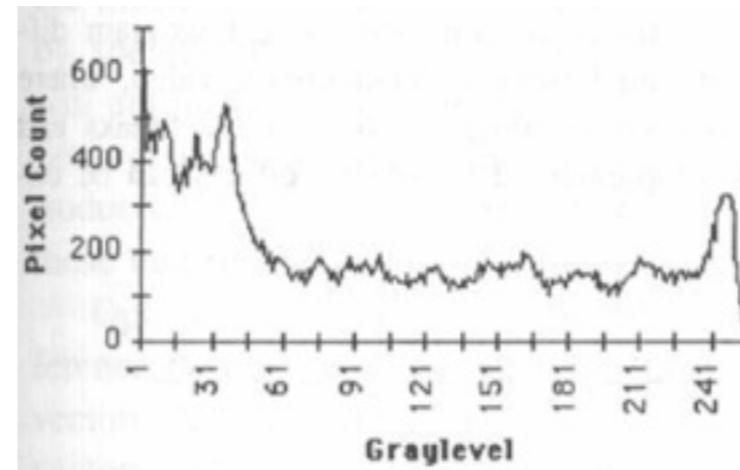

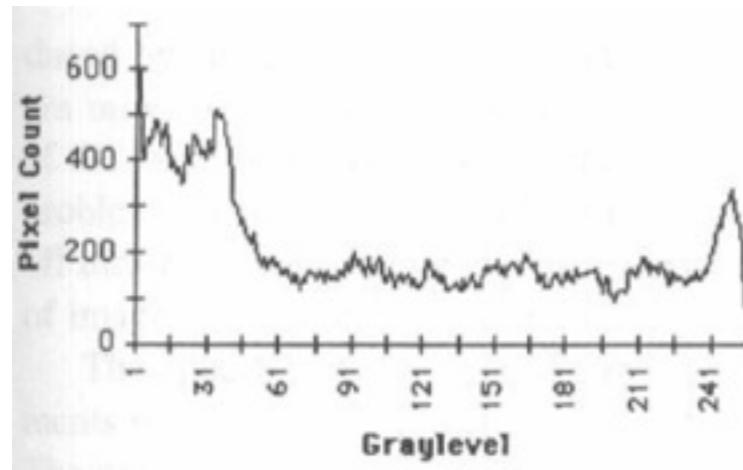

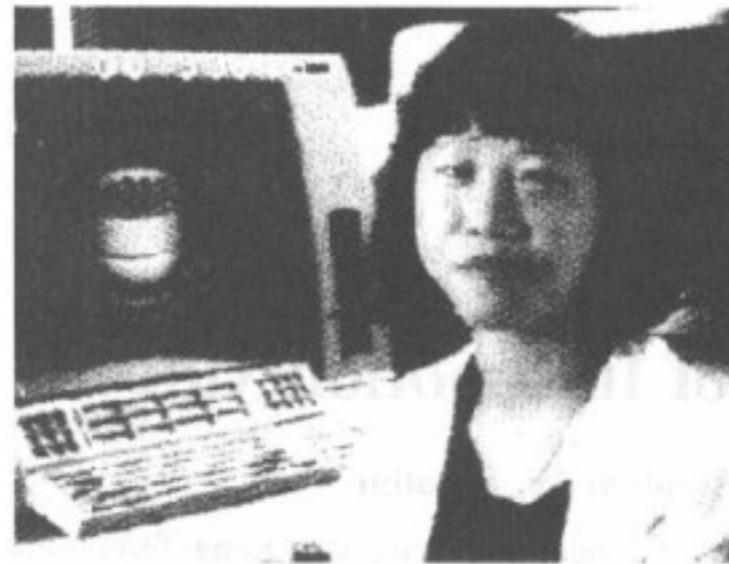

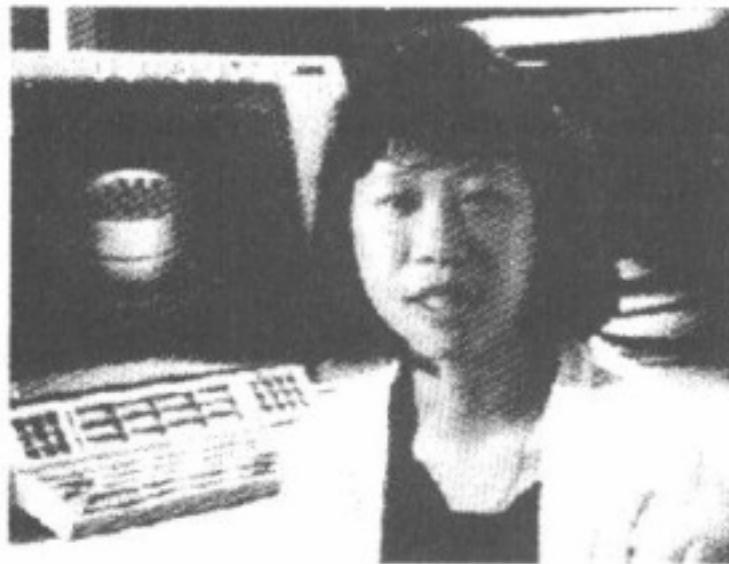

Basic video segmentation metrics

- Histogram comparison
 - Basic
 - Tolerate motion better
- χ^2 -test
- Color level can also be used but only the MSB to save the number of bins

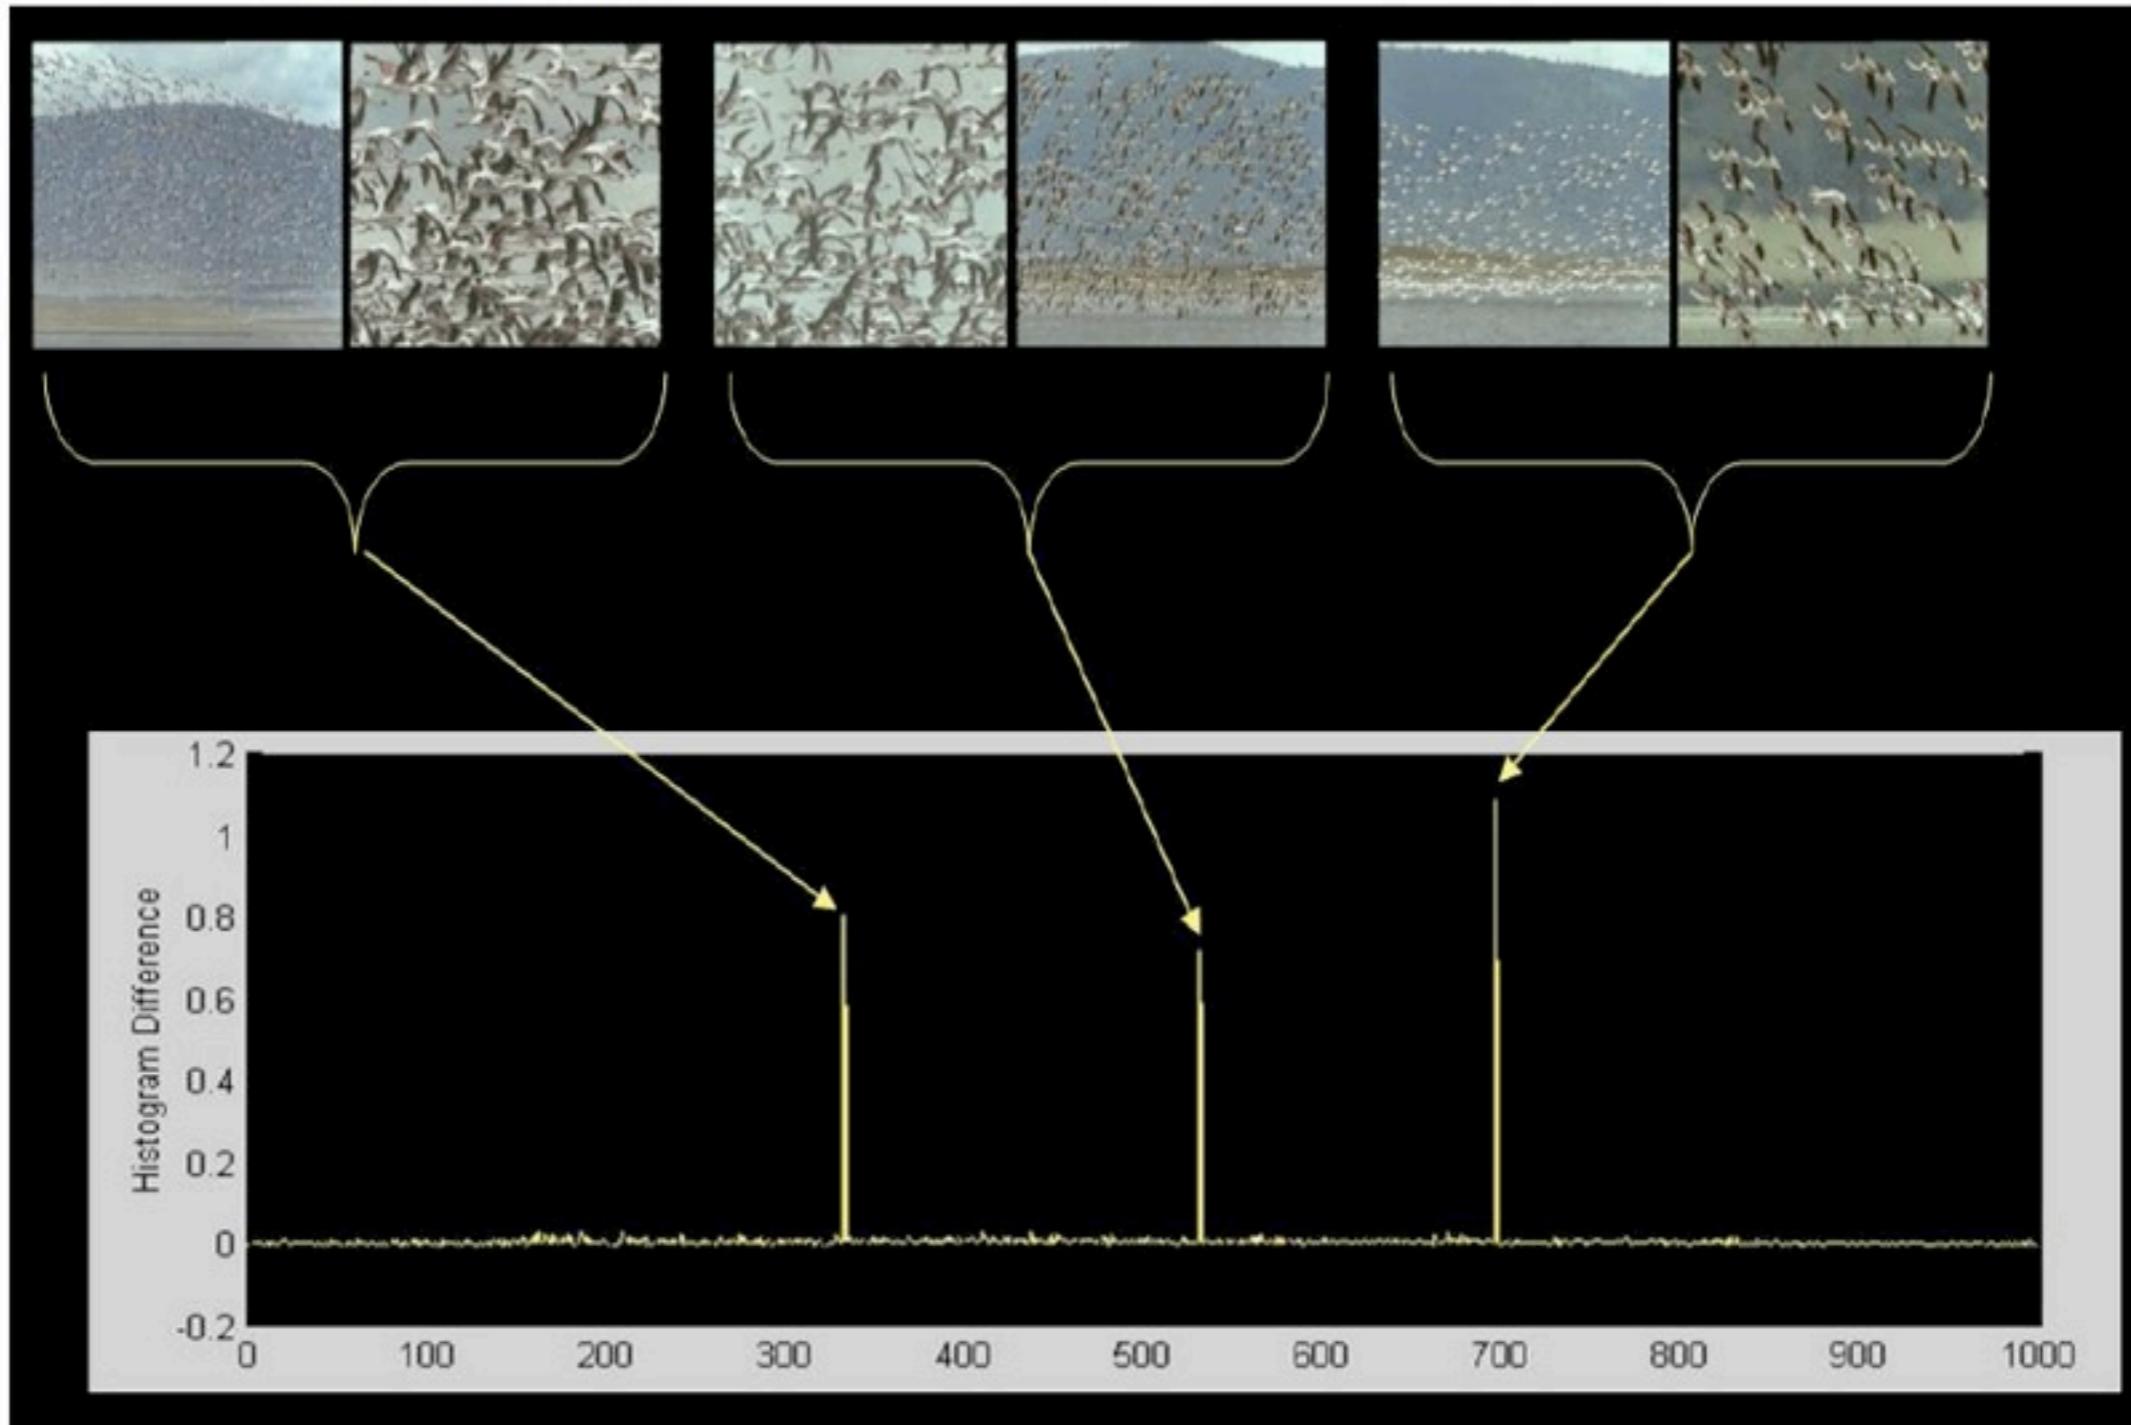

$$SD_i = \sum_{j=1}^G |H_i(j) - H_{i+1}(j)|$$

$$SD_i = \sum_{j=1}^G \frac{|H_i(j) - H_{i+1}(j)|^2}{H_{i+1}(j)}$$

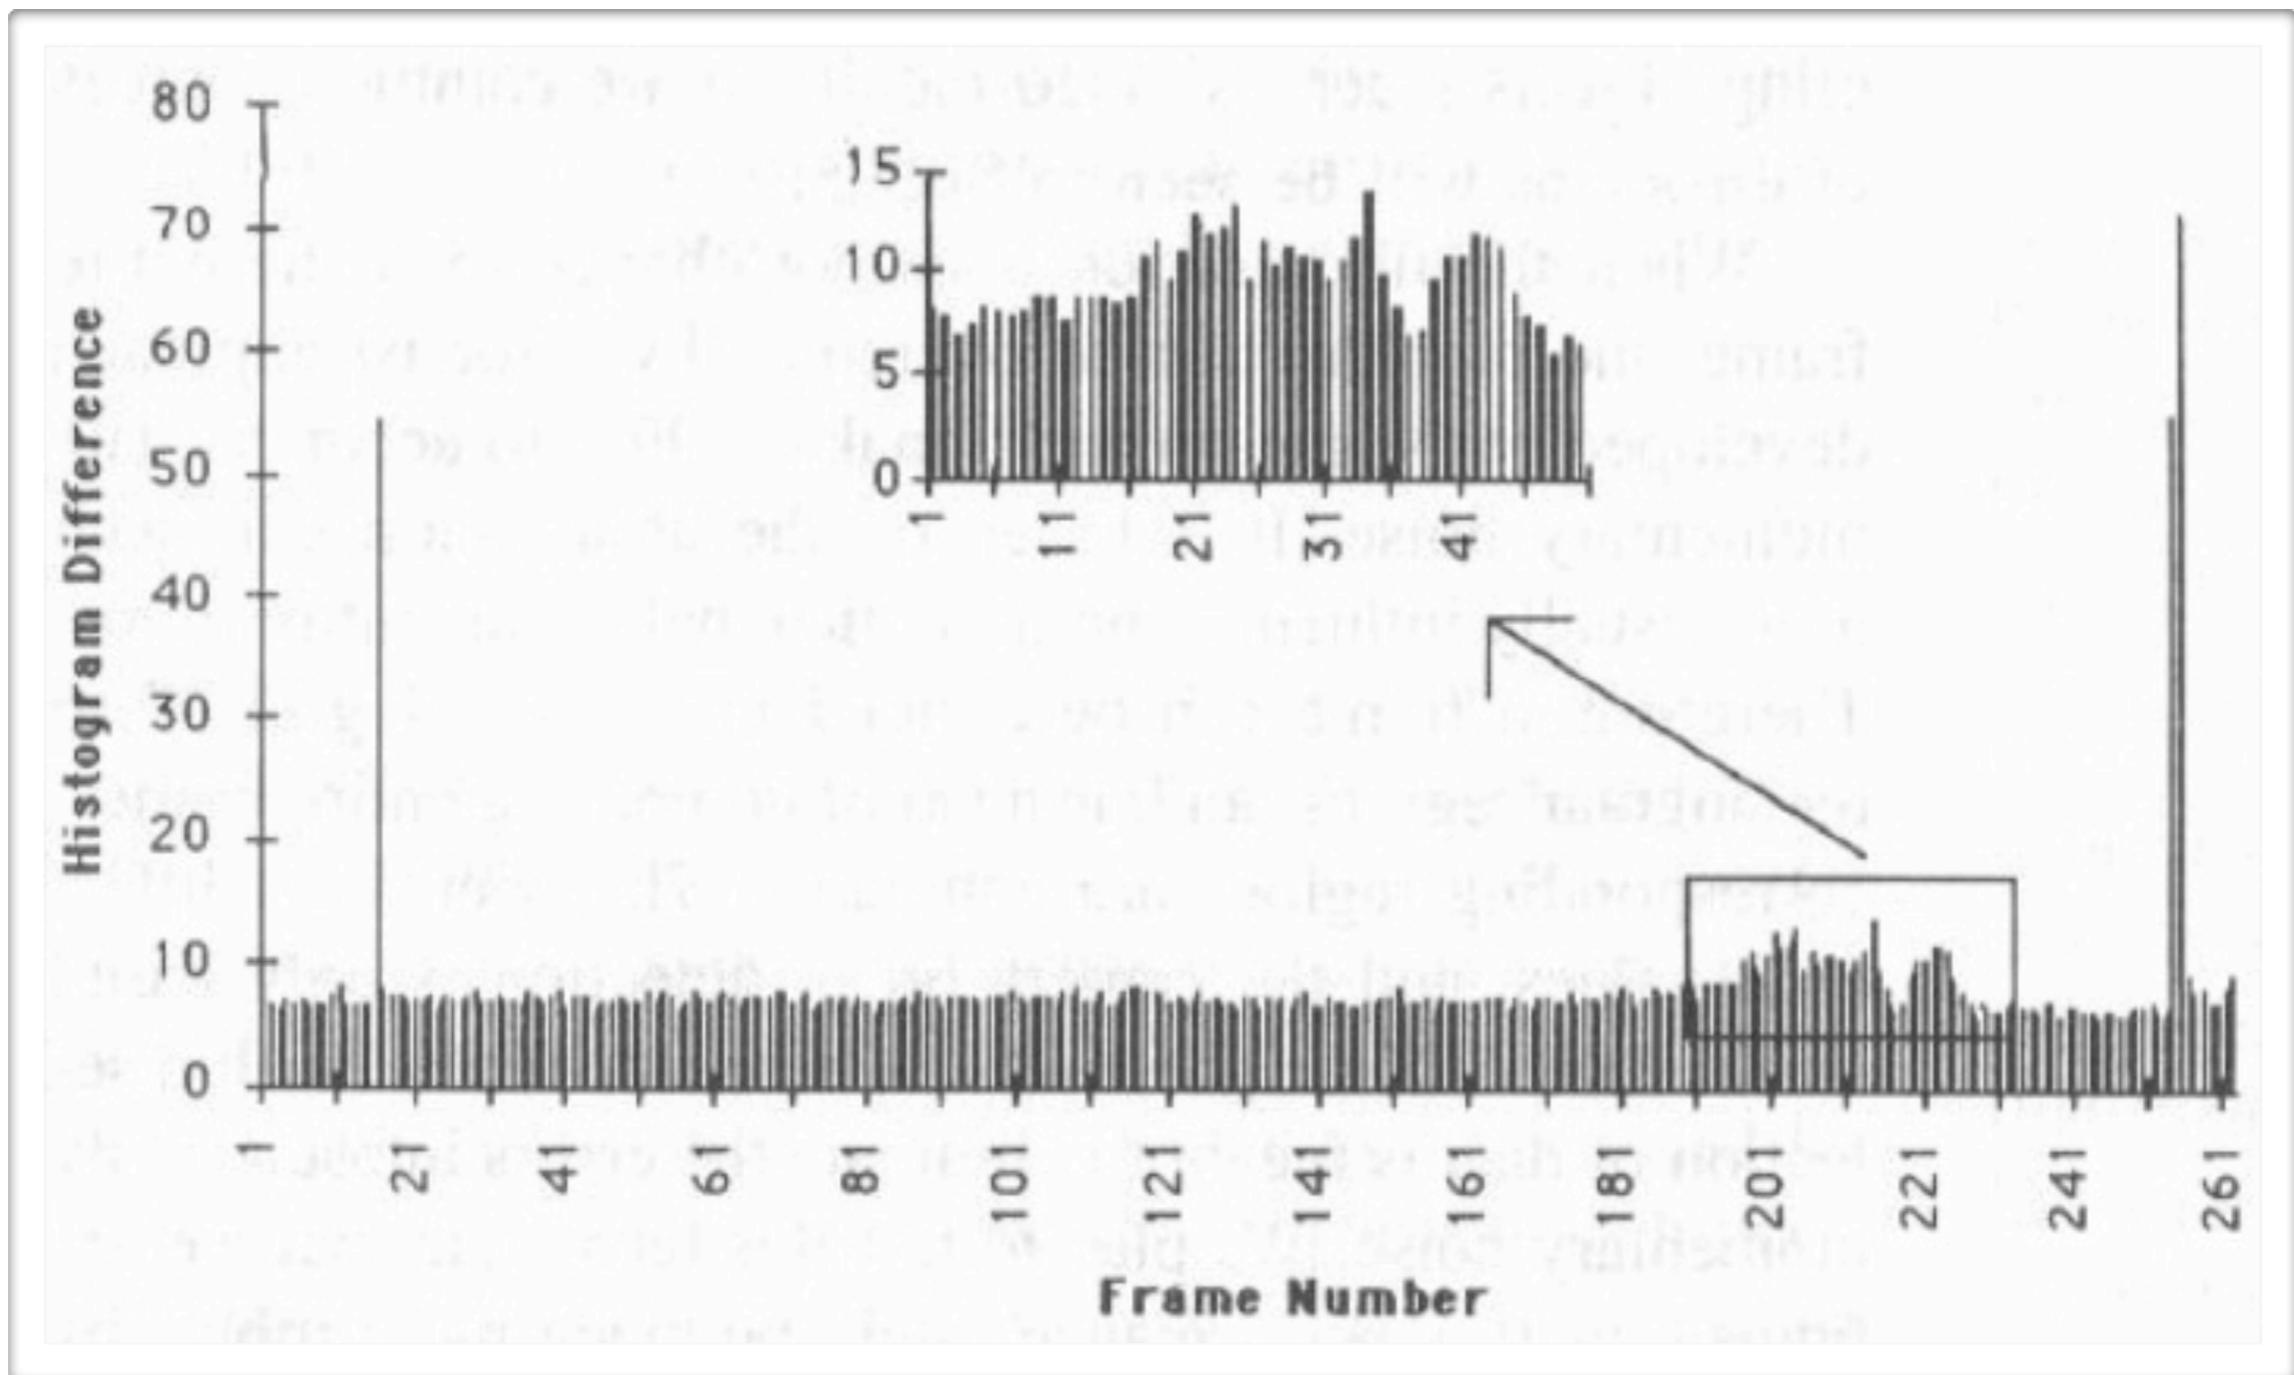

Sample of using histogram

Scene Cut

Gradual transition detection

Gradual transition detection

- Twin-comparison
 - Use two thresholds T_b and T_s to accommodate both **short-term** and **long-term** transitions
 - Differences of (F_1, F_2) , (F_2, F_3) , (F_3, F_4) are small, but difference of (F_1, F_4) is still big

1

2

3

4

- **Twin-comparison**
 - F_s — the potential beginning frame of the transition
 - F_e — the ending frame of the transition

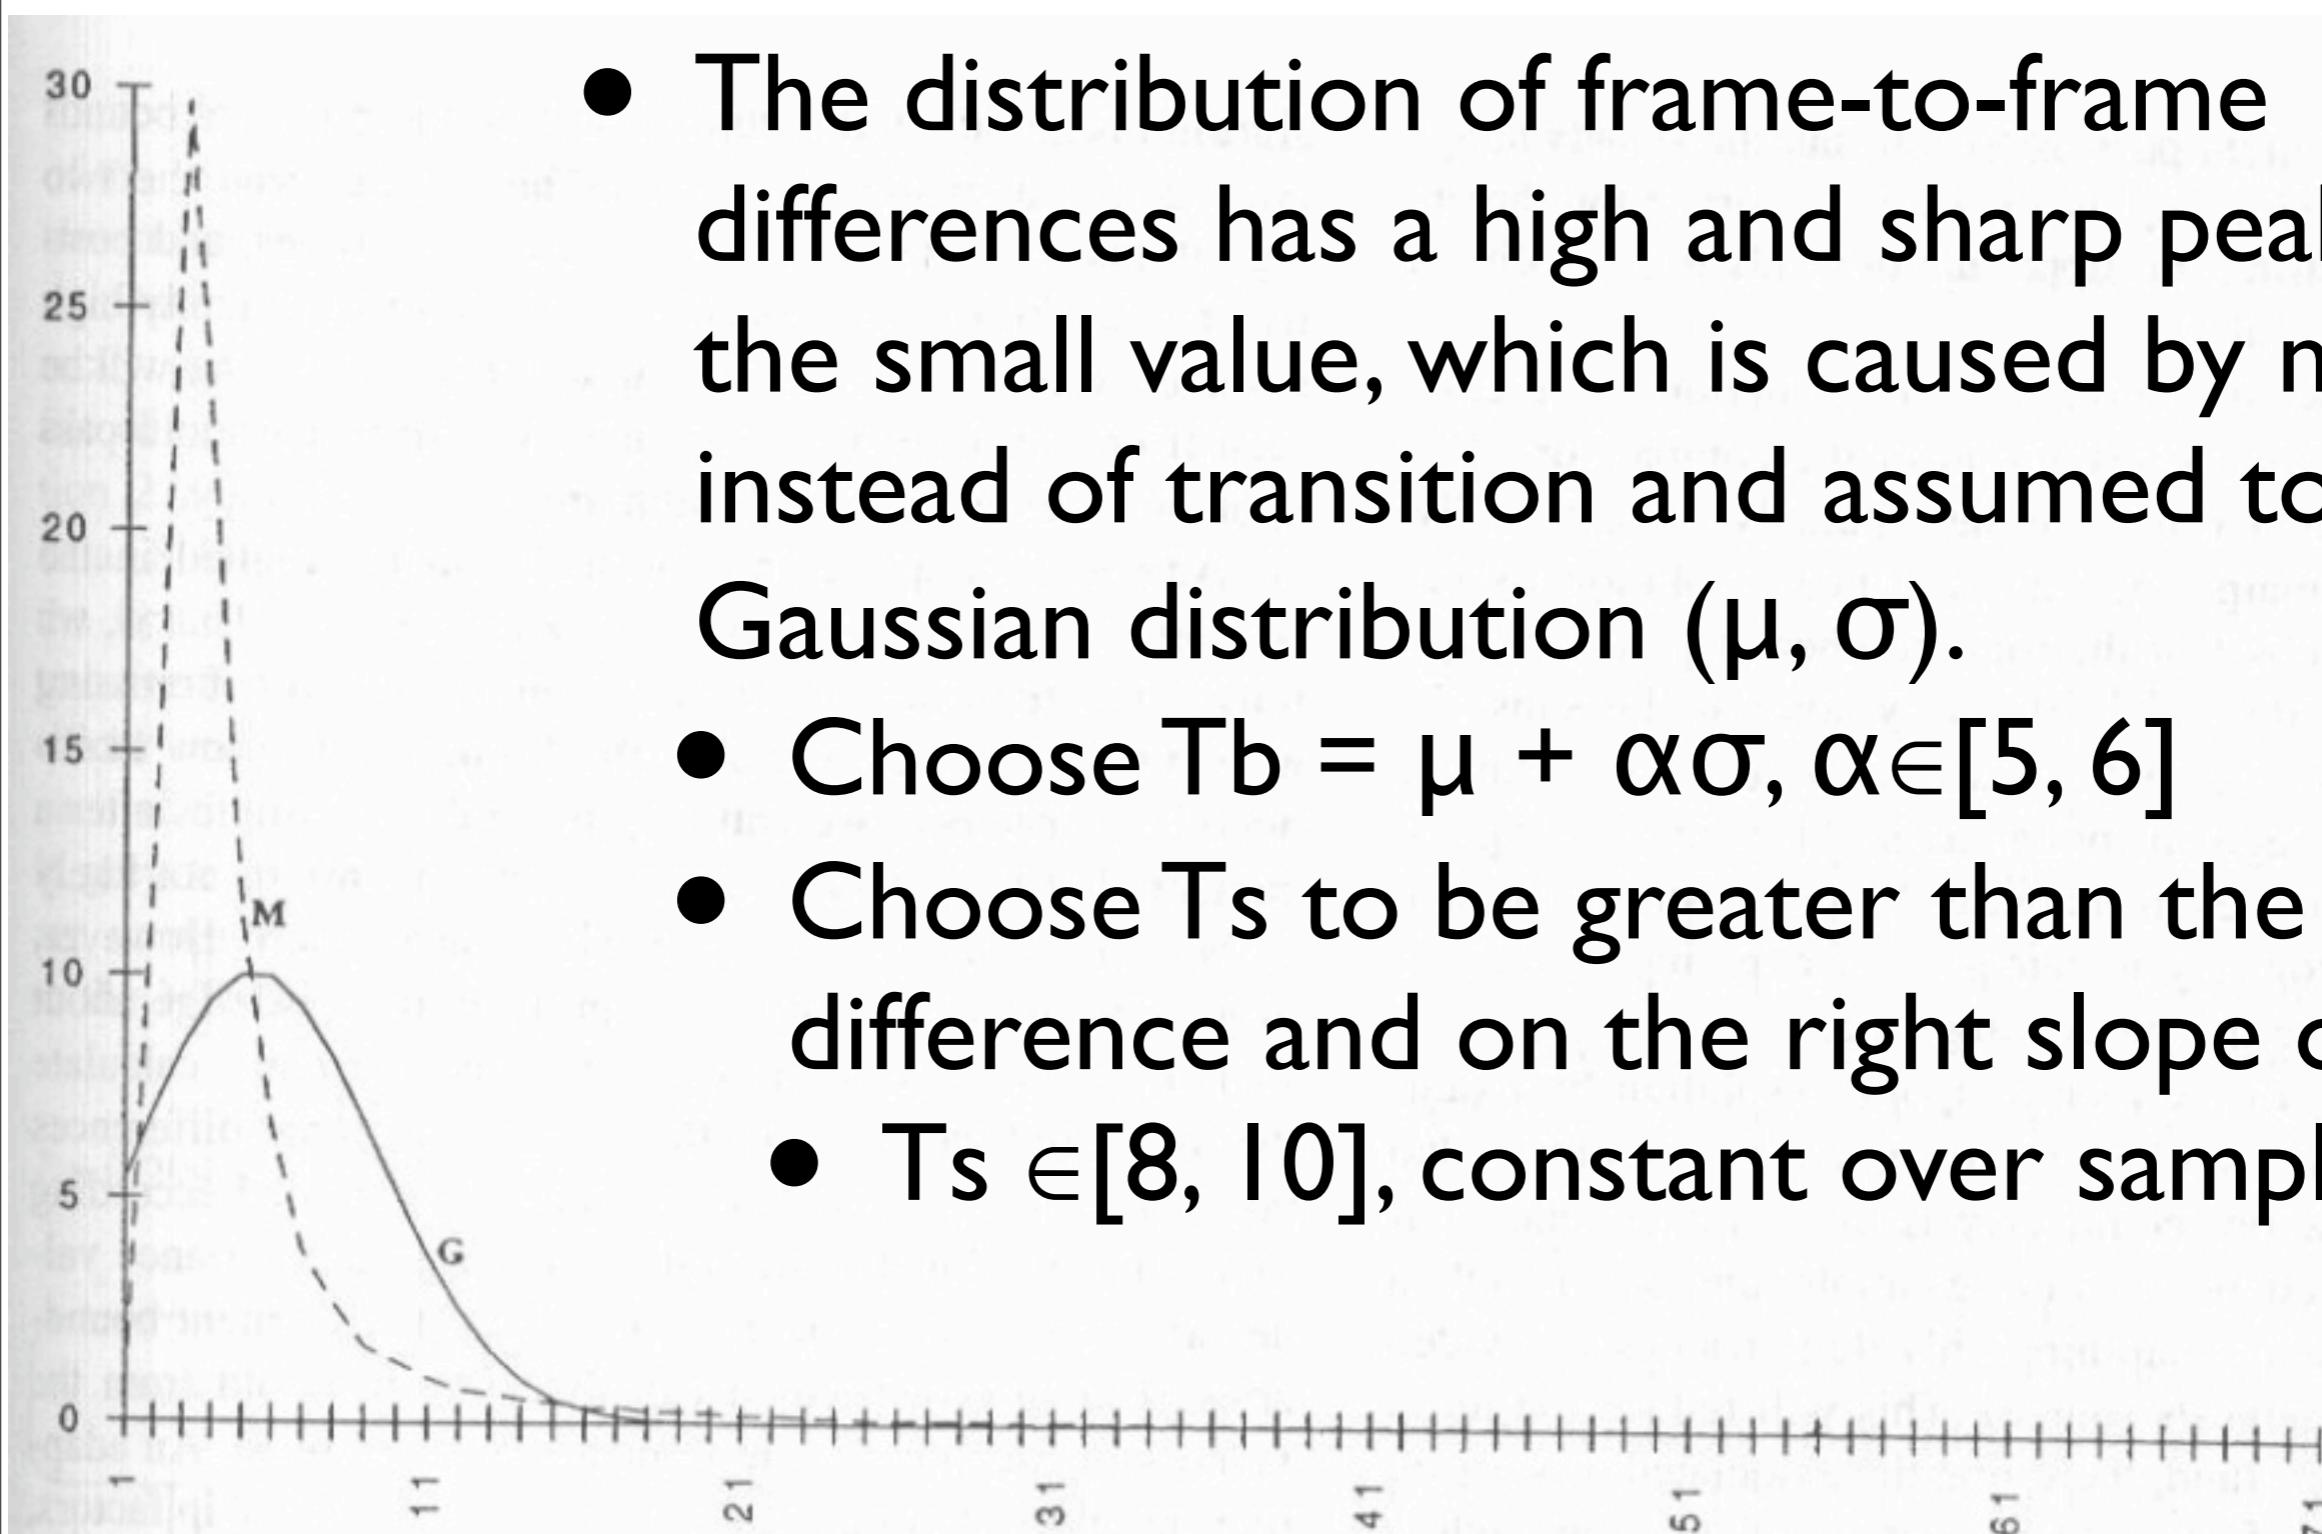

```

scan frame
if (Diff( $F_i$ ) ≥  $T_b$ )
    detect as camera break
else if ( $T_b > \text{Diff}(F_i) \geq T_s$ )
     $F_s \leftarrow F_i$ 
     $i \leftarrow i + 1$ 
    while ( $\text{Diff}(F_i) \geq T_s$ )
         $i \leftarrow i + 1$ 
    if ( $\text{Diff}(F_s, F_i) \geq T_b$ )
         $F_e \leftarrow F_i$ 

```

Threshold selection (T_b, T_s)

- The distribution of frame-to-frame differences has a high and sharp peak near the small value, which is caused by noise instead of transition and assumed to follow Gaussian distribution (μ, σ) .
 - Choose $T_b = \mu + \alpha\sigma, \alpha \in [5, 6]$
 - Choose T_s to be greater than the mean difference and on the right slope of M
 - $T_s \in [8, 10]$, constant over samples

Multi-pass approach

- Scanning all frames could be computationally hard
- Temporal skipping is more useful
 - e.g. one out of every 10 frames
 - Better for detecting gradual transition
 - May miss camera break
 - May get false detection (distance increased)
- Multi-pass approach
 - First pass, use either pair-wise or histogram with large skip factor and smaller Tb to collect the potential regions.
 - Second pass, two methods may be applied together (hybrid) to search the candidate regions while increasing the confidence.

Distinguish camera movement

- To distinguish gradual transitions from changes made by camera movements
- Basic approach— observing **optical flow** via motion vectors

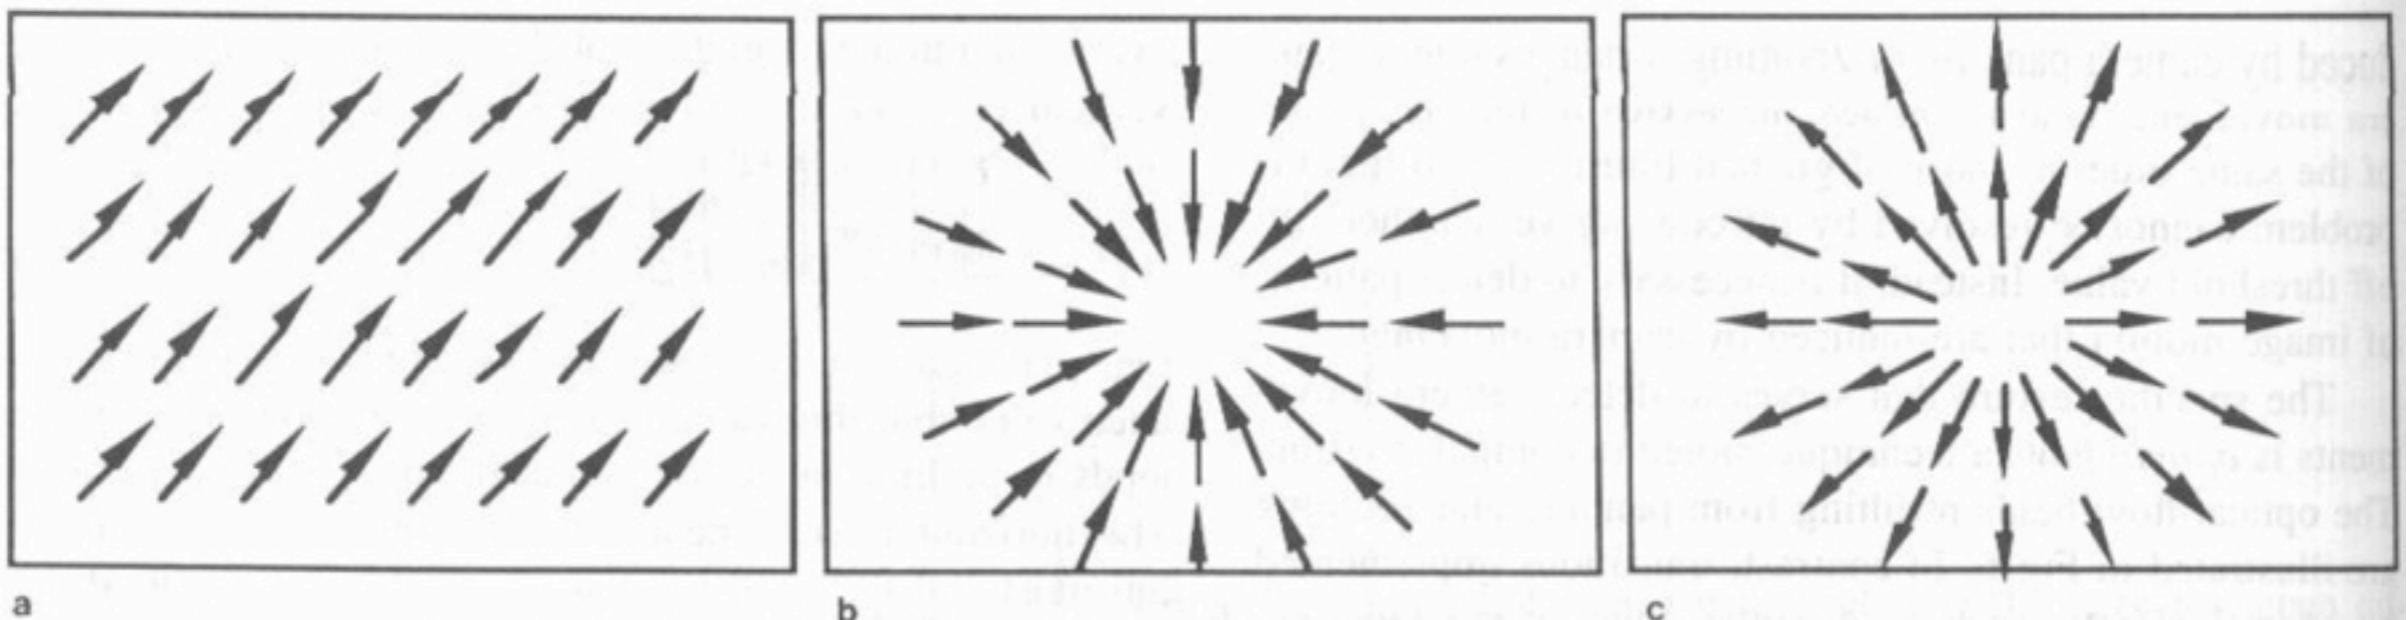

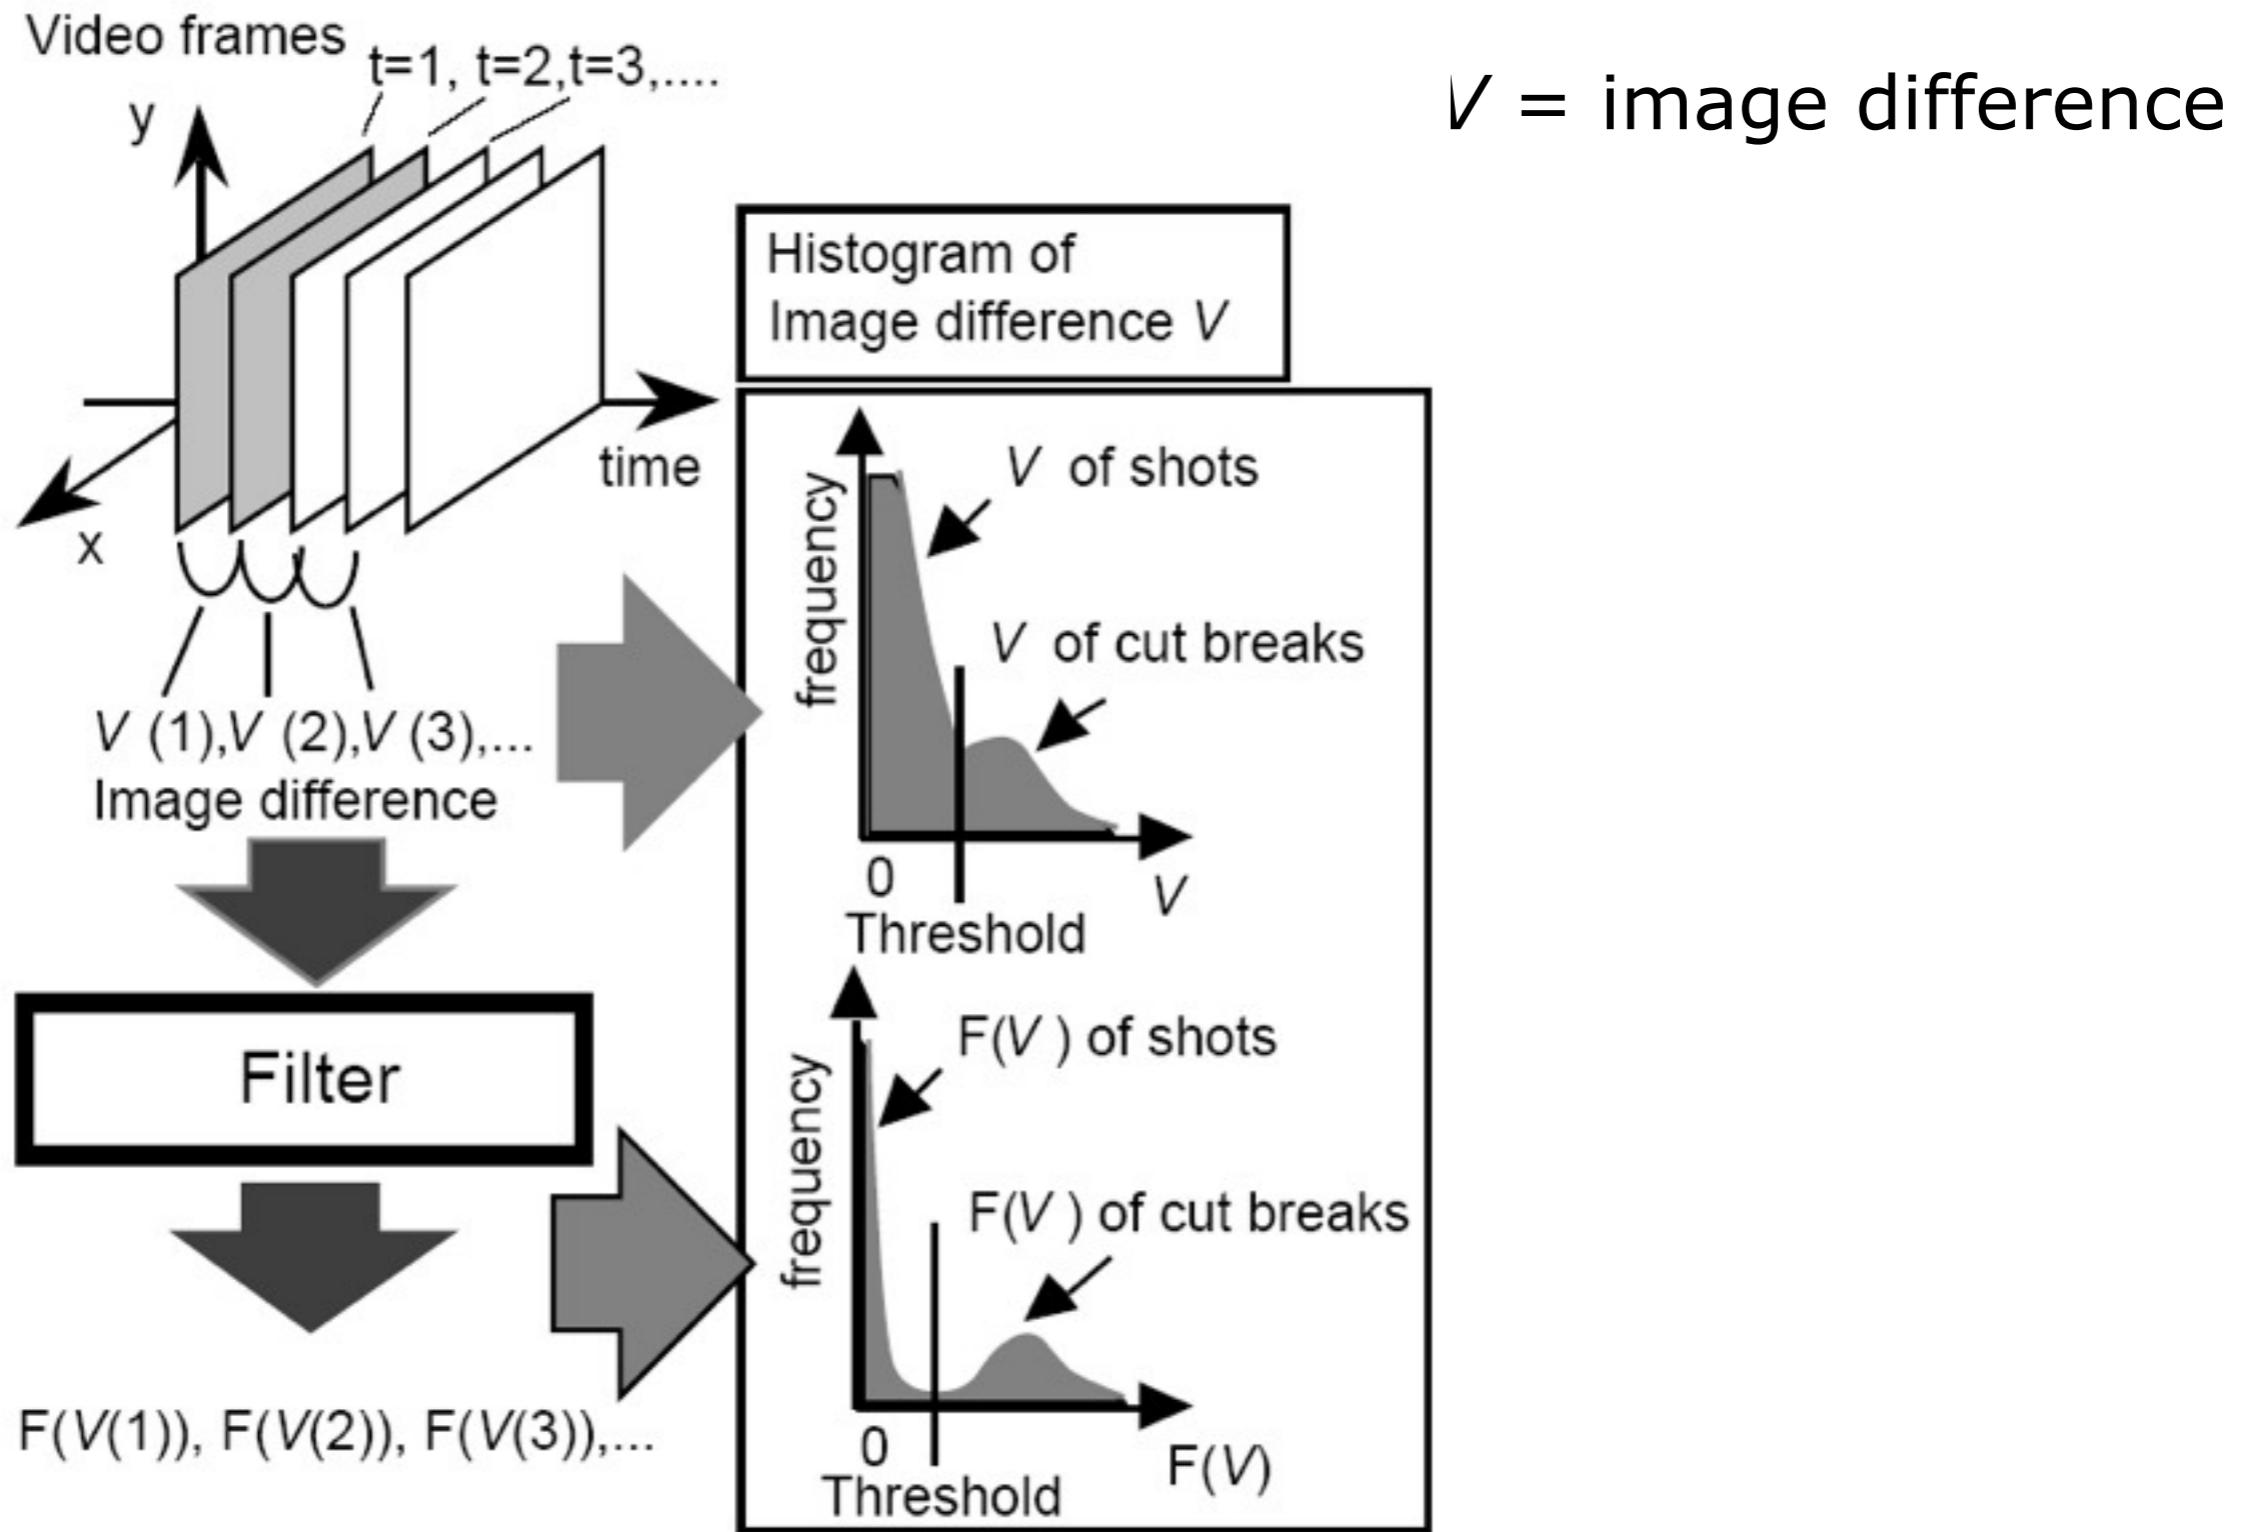

Fig. 6a–c. Motion vector patterns resulting from camera panning and zooming. a ✓ Camera panning direction. b Camera zoom-out. c Camera zoom-in

Distinguish camera movement

- **Panning**
 - Distribution of motion vectors has a single modal value (θ_m) that corresponds to the panning direction.
- **Zooming**
 - The vertical components of top and bottom motion vectors have different signs.
 - Similarly for horizontal components of left and right motion vectors.

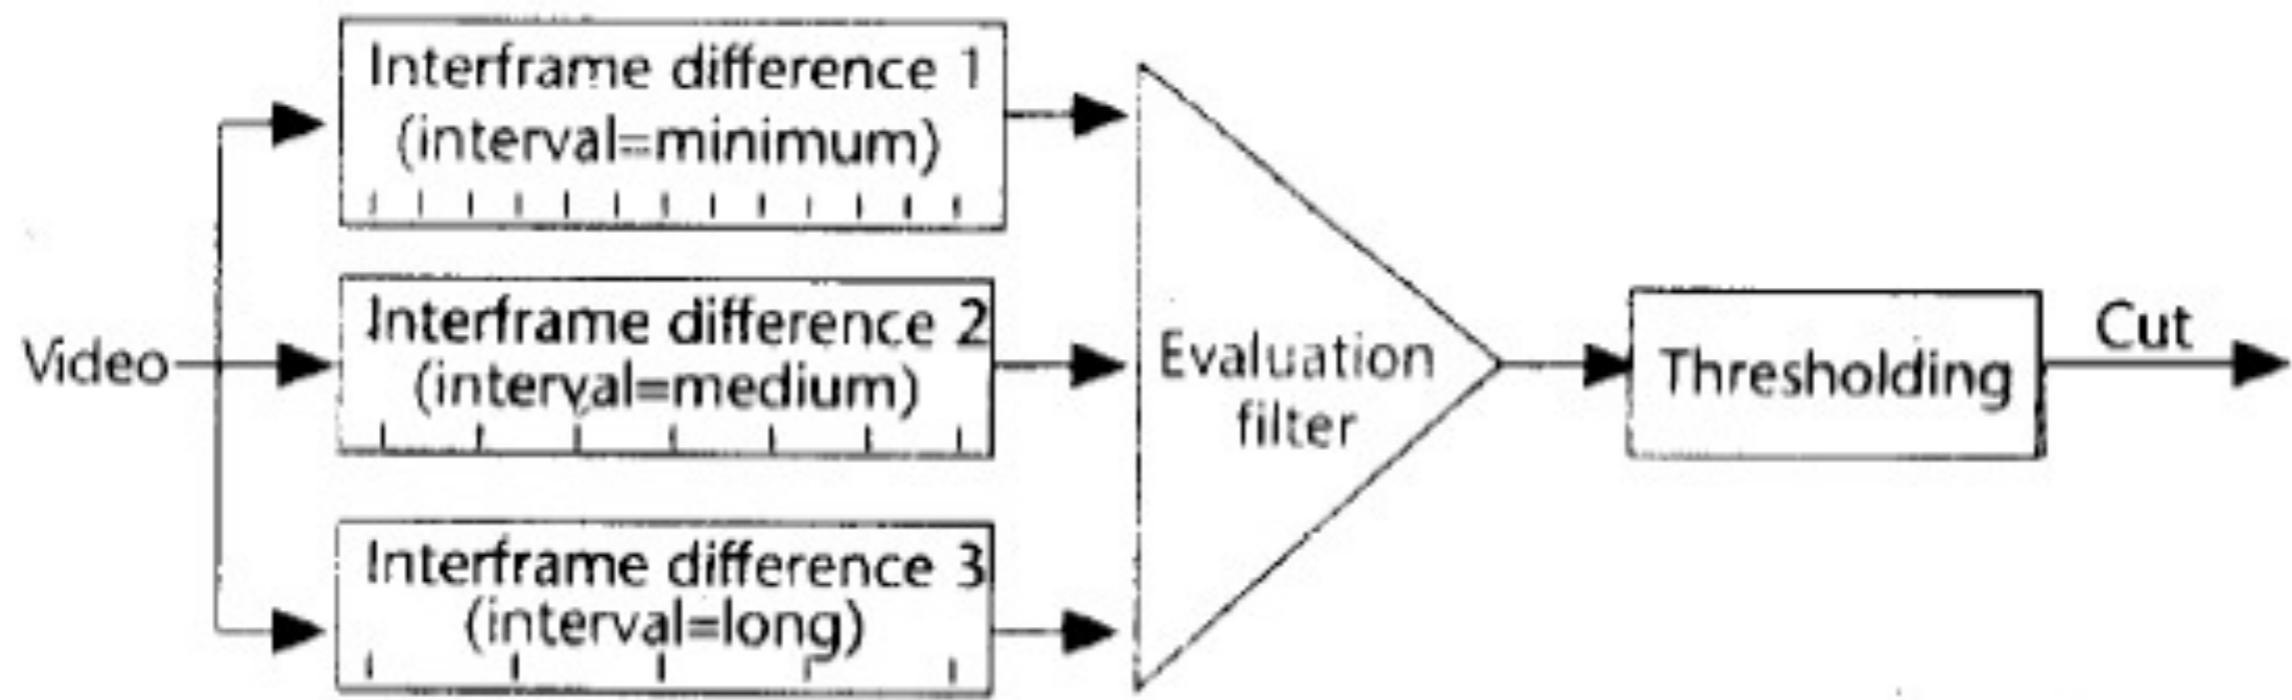

$$\sum_k^N |\theta_k - \theta_m| \leq \Theta_p$$

Yet Another Video Segmentation

Video Segmentation: Solution

- 92-98% success rate over 4.5 hours of video (news, movies, documentaries)
- 90% success when 1/3 of all cuts were via special affects

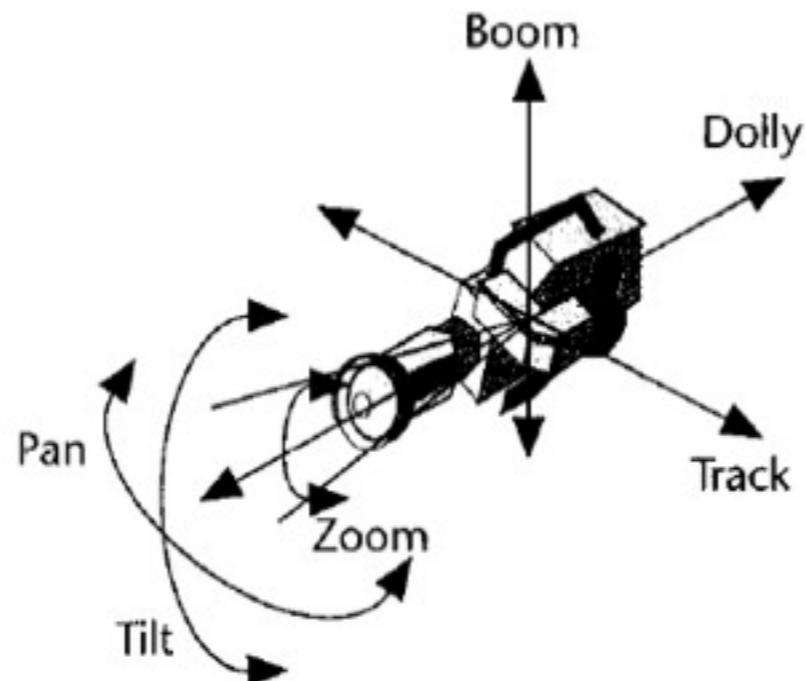

Shot Analysis

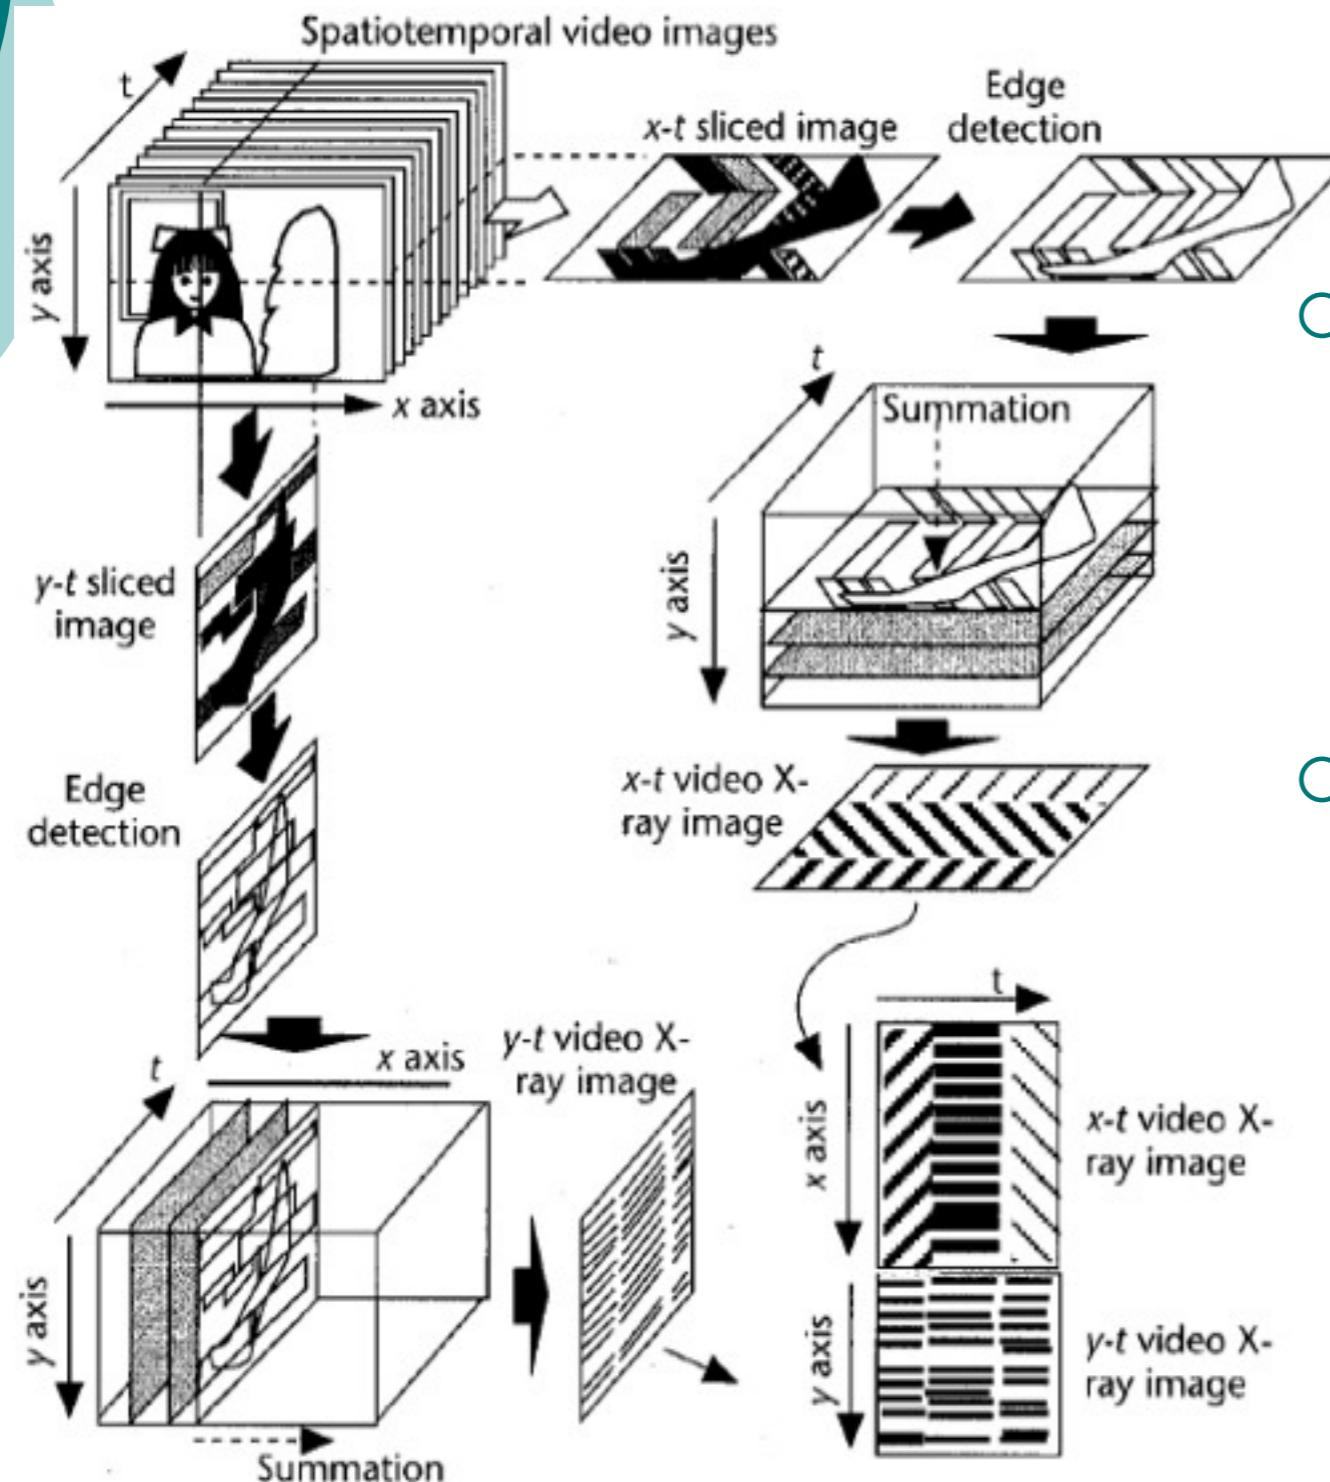

- Shot is simply sequence of frames capturing a scene's spatial and temporal context.
- Extract this information:
 - Camera work yields spatial situation
 - Color info yields object information

Camera Work Information Extraction

- Camera movement causes global change in objects.
- Resulting point traces = motion vectors
- Motion vectors yield camera work parameters
- Computationally complex, not robust

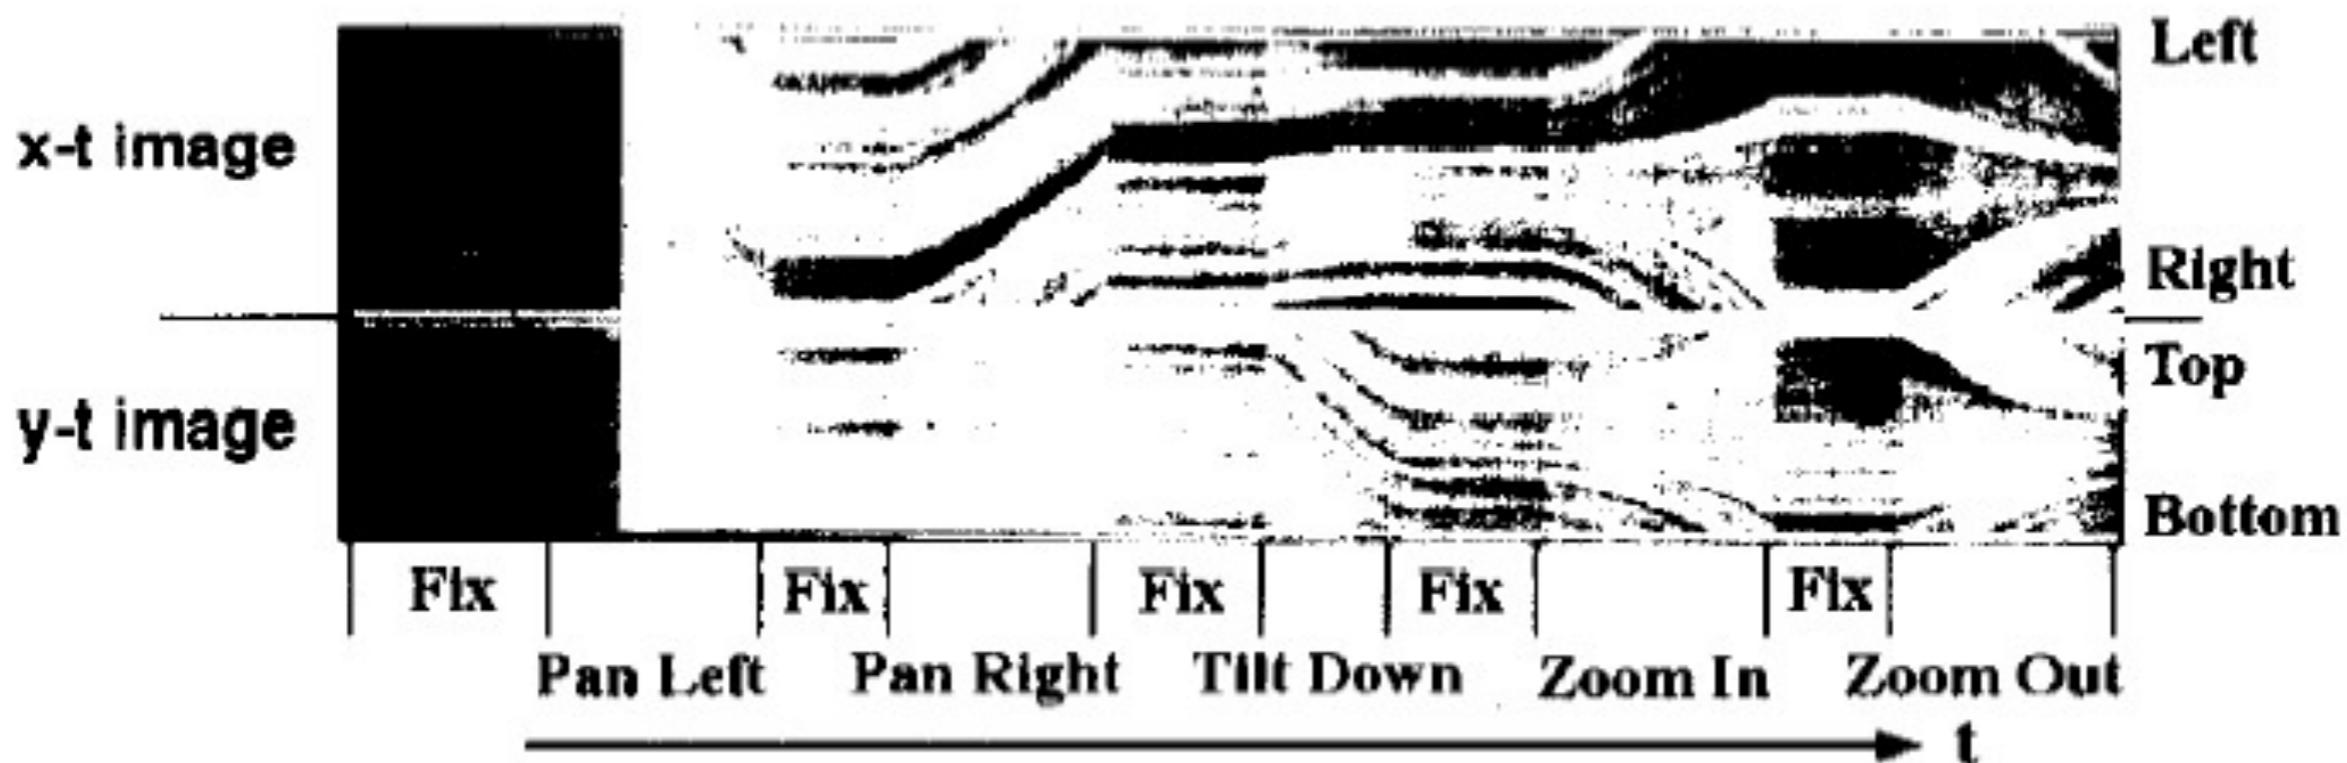

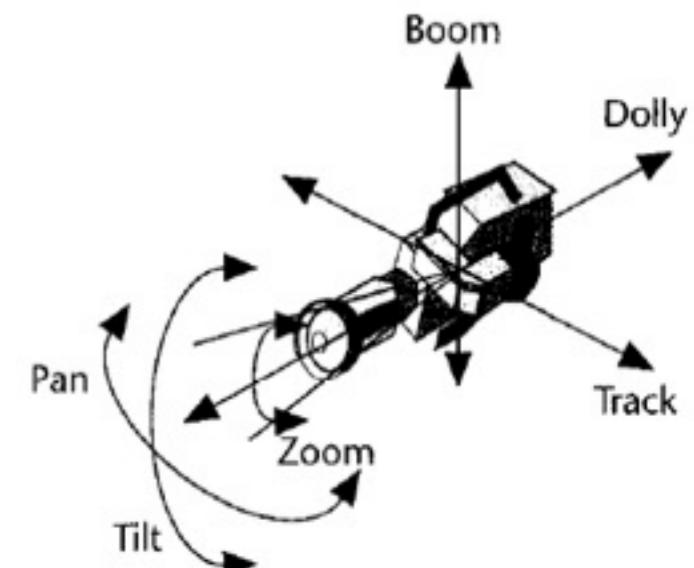

Camera Work Information Extraction

- Proposal based on video x-ray imaging.
- Easy calculations, robust

Camera Work Information Extraction

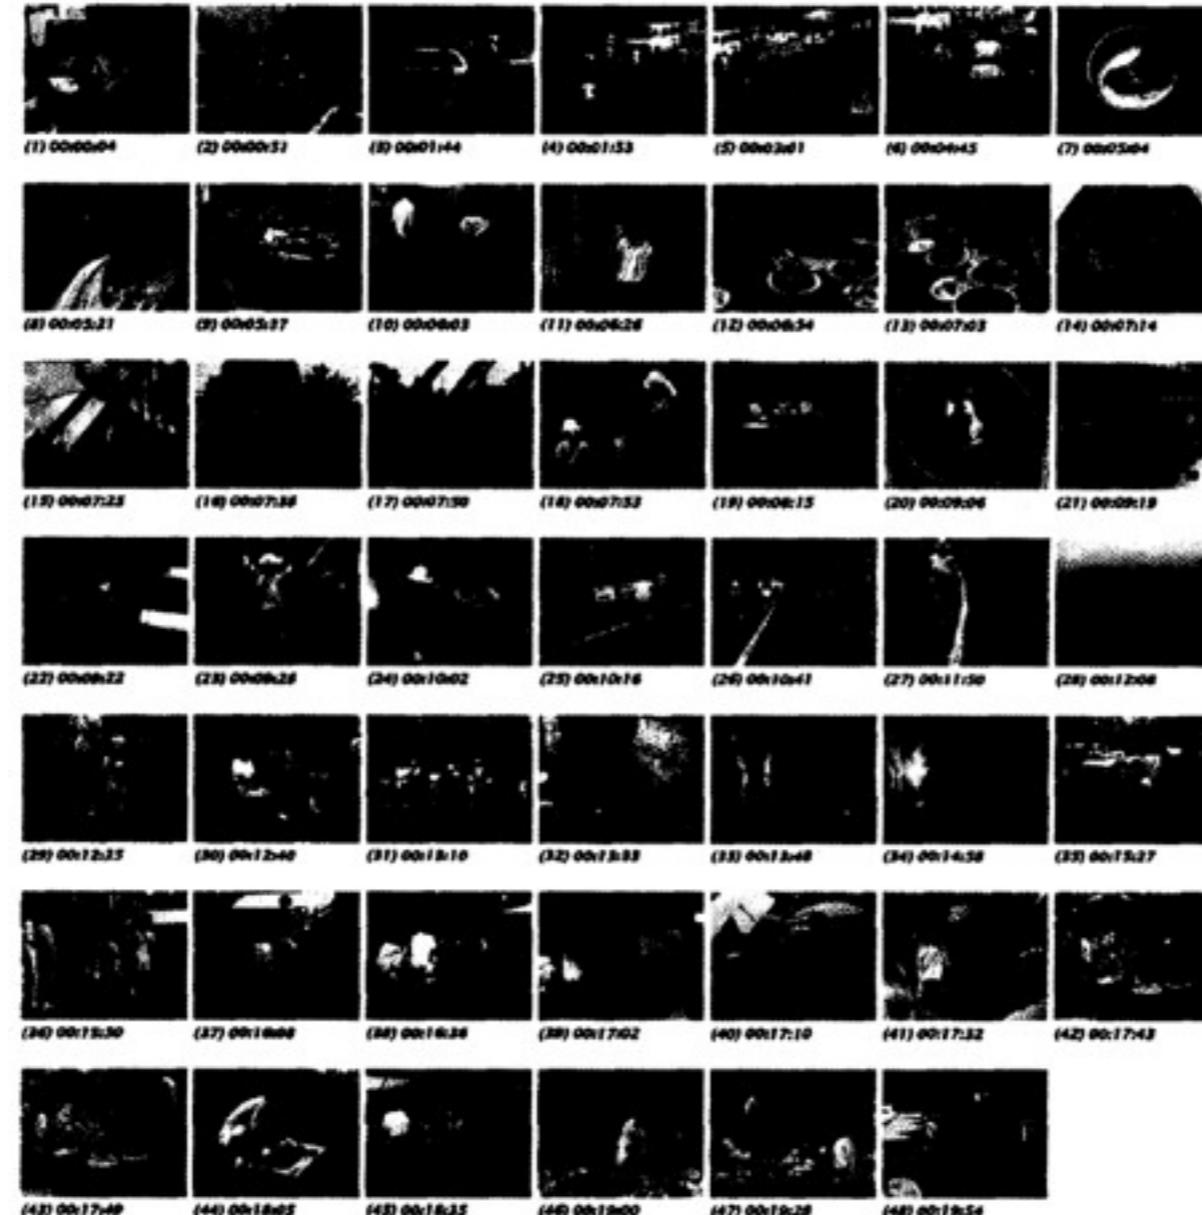

- Parallel to time = fixed camera
- Slant = camera pan
- Degree of slant = speed of pan
- Line spread = zoom
- No information present for track and dolly

New Video Interfaces

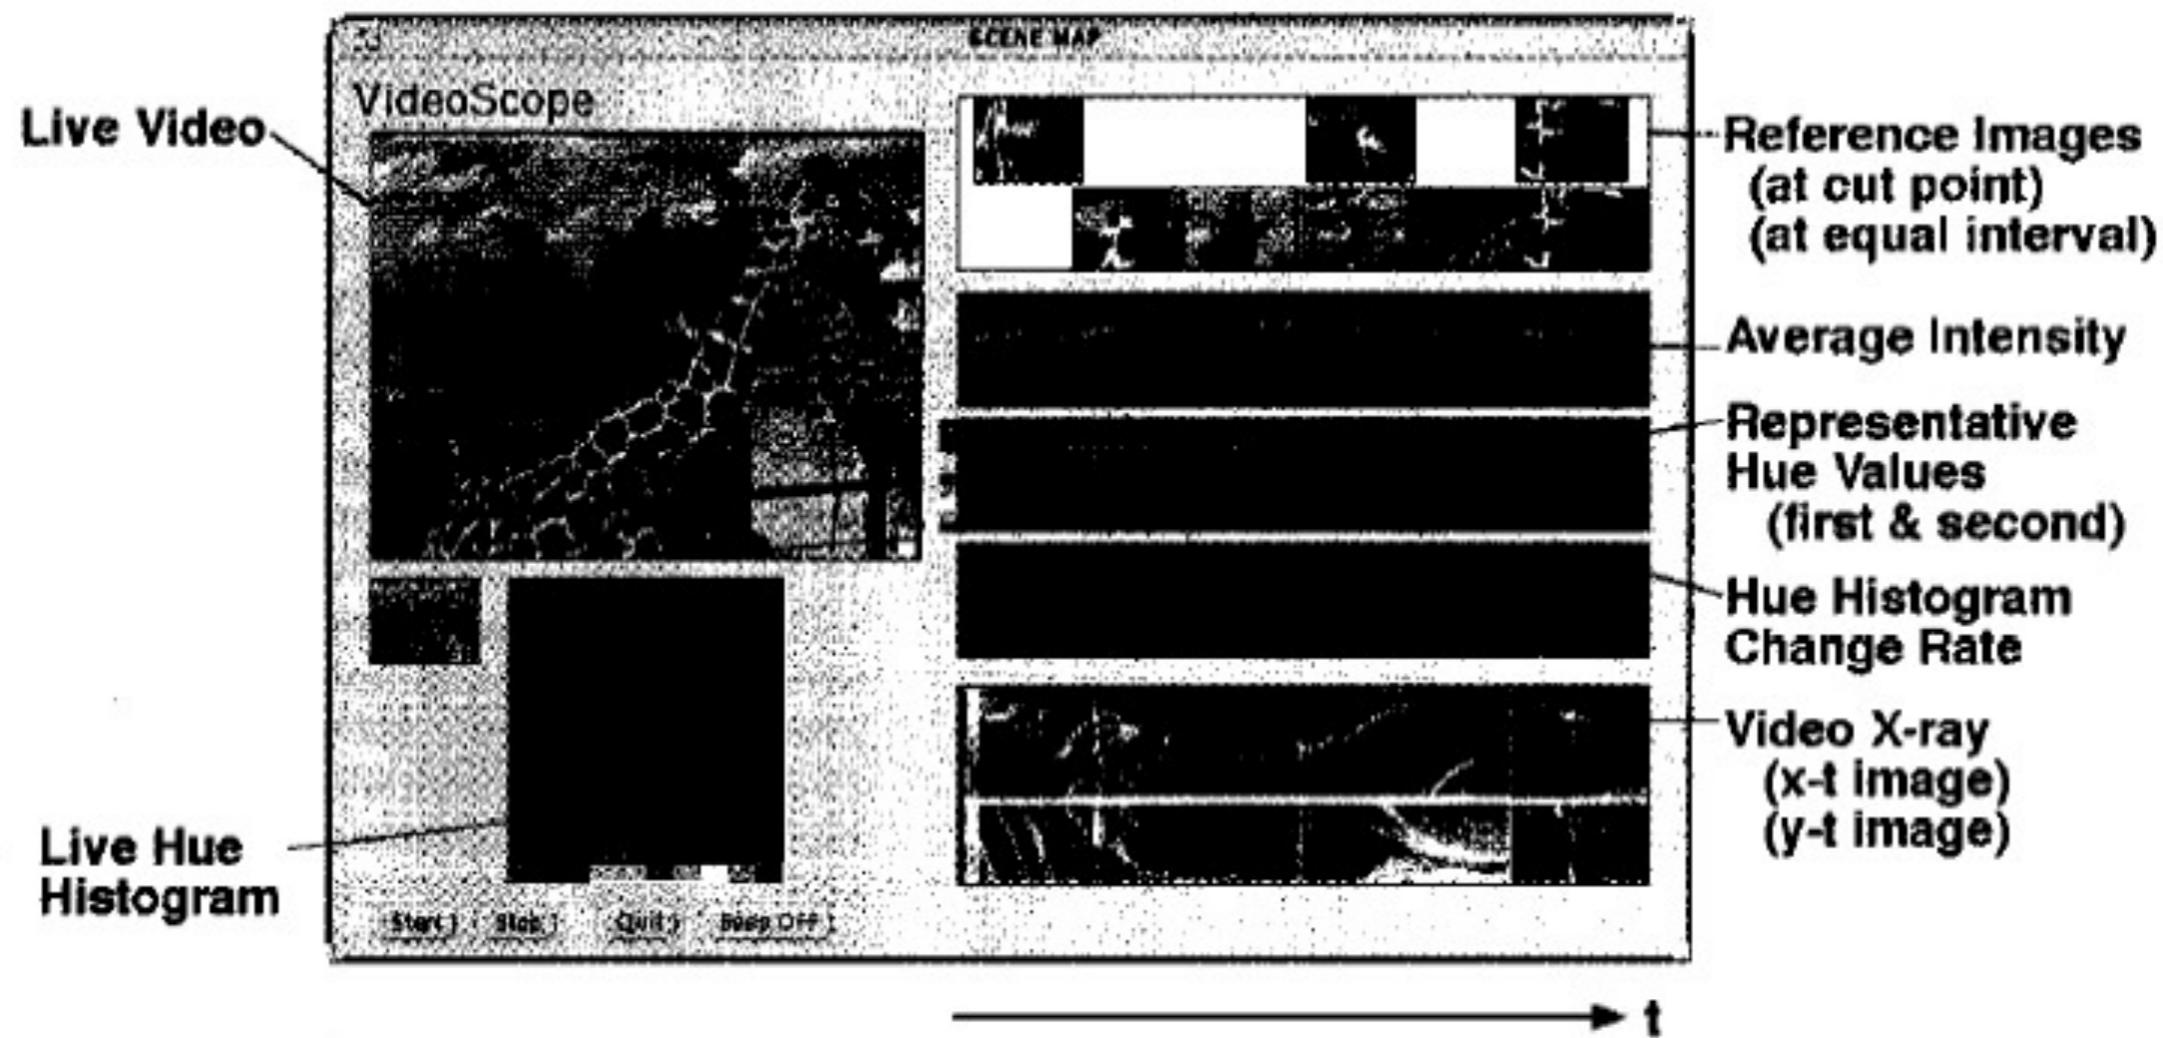

- VideoScope
- VideoSpaceIcon
- ViewSpaceMonitor
- PaperVideo

PaperVideo

- Photo albums and video indexing.
- Shows potential simplicity of structured video apps.

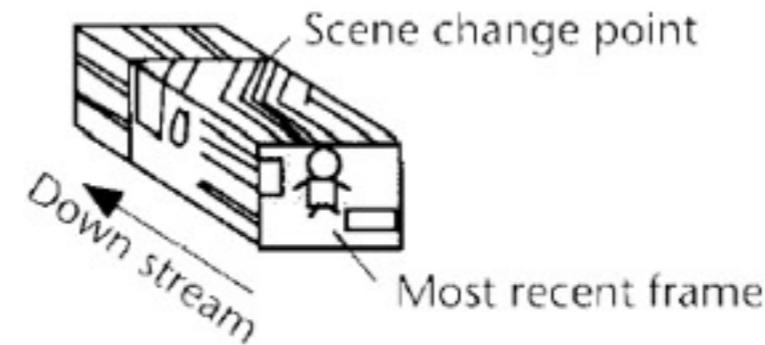

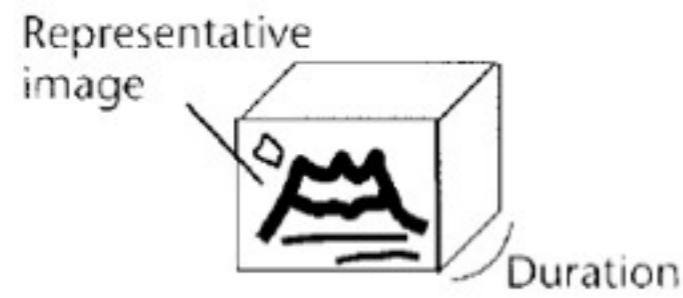

VideoScope

- Possible use as video engineering tool.
- Shows potential complexity of structured video apps.

Related Work

- Importance of visual interface
 - Must activate user's visual sense
 - Must stimulate user's ability to manipulate video

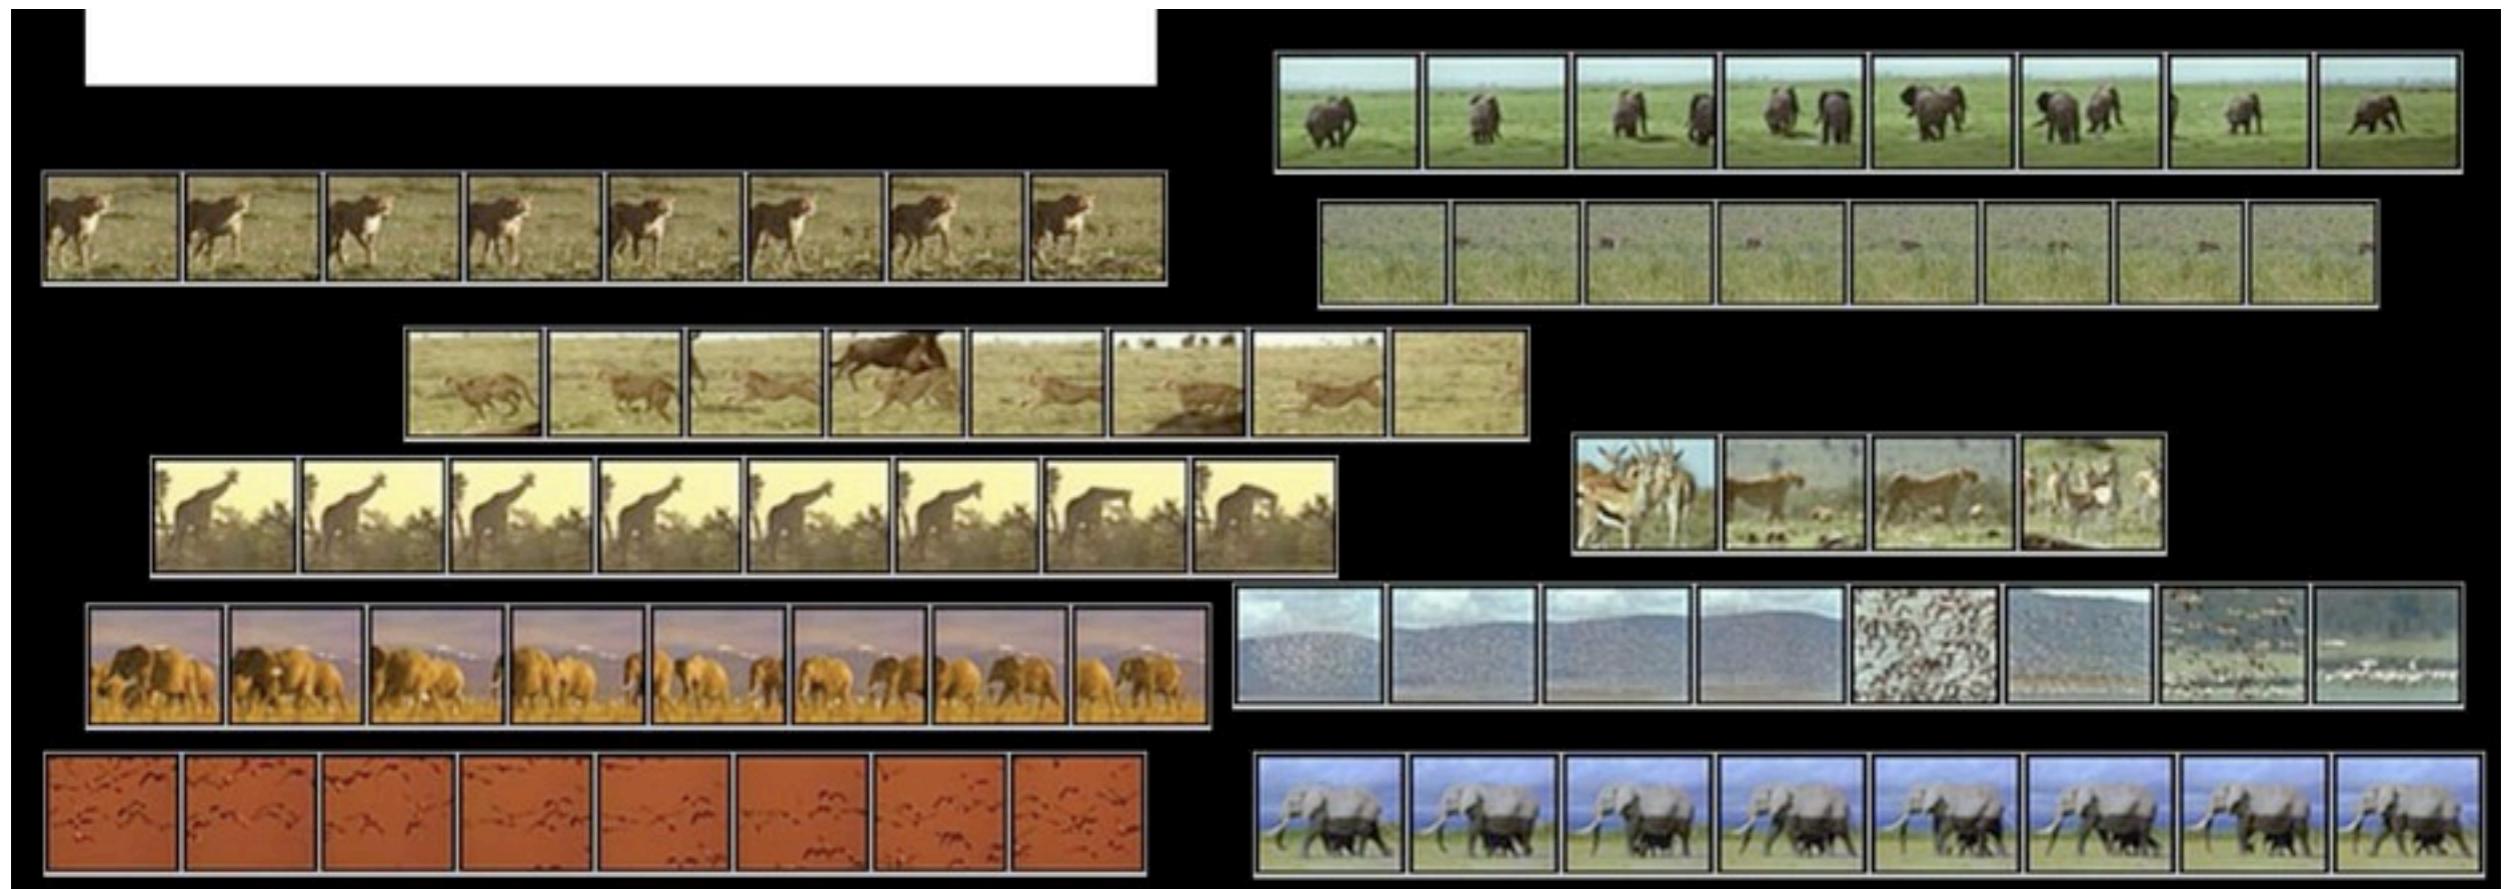

- What can be done in video production stage?

video_key_frame/key_frame_index.html](http://www.cs.ust.hk/~rossiter/mm_projects/video_key_frame/key_frame_index.html)

关键帧提取技术

- 镜头边界法
 - 选取镜头中的首帧和末帧
- 颜色特征法
 - 首帧为关键帧，其后比较与前面关键帧的颜色差异
- 运动分析法
 - 分析相机的运动
- 聚类分析法

聚类分析法

- 设一个镜头 $S = \{f_1, f_2, \dots, f_m\}$
 - 找关键帧 $[F_1, F_2, \dots, F_n]$
 - 定义帧间距离 $d(f_i, f_j)$

Step 0. 设定阈值，选定初始n个关键帧位置

Step 1. 按照到关键帧的最小距离重新划分

Step 2. 指定每一聚类的**中心帧**为新的关键帧。

如果与上次划分区别不大则停止，否则重复

Step 1和Step 2.
